

As you are now the owner of this document which should have come to you for free, please consider making a donation of £1 or more for the upkeep of the (Radar) website which holds this document. I give my time for free, but it costs me money to bring this document to you. You can donate here <https://blunham.com/Misc/Texas>

Many thanks.

Please do not upload this copyright pdf document to any other website. Breach of copyright may result in a criminal conviction.

This Acrobat document was generated by me, Colin Hinson, from a document held by me. I requested permission to publish this from Texas Instruments (twice) but received no reply. It is presented here (for free) and this pdf version of the document is my copyright in much the same way as a photograph would be. If you believe the document to be under other copyright, please contact me.

The document should have been downloaded from my website <https://blunham.com/>, or any mirror site named on that site. If you downloaded it from elsewhere, please let me know (particularly if you were charged for it). You can contact me via my Genuki email page: <https://www.genuki.org.uk/big/eng/YKS/various?recipient=colin>

You may not copy the file for onward transmission of the data nor attempt to make monetary gain by the use of these files. If you want someone else to have a copy of the file, point them at the website. (<https://blunham.com/Misc/Texas>). Please do not point them at the file itself as it may move or the site may be updated.

It should be noted that most of the pages are identifiable as having been processed by me.

I put a lot of time into producing these files which is why you are met with this page when you open the file.

If you find missing pages, pages in the wrong order, anything else wrong with the file or simply want to make a comment, please drop me a line (see above).

It is my hope that you find the file of use to you.

Colin Hinson

XDS TMS9995 Emulator Hardware

XDS Extended Development Support
Installation and Operation Guide

PREFACE

The purpose of this manual is to familiarize the user with the TMS9995 Emulator board set, the target connector and the function of the status indicators on the XDS (Extended Development Support System). This manual also describes installation instructions for the TMS9995 Emulator board set, including the target connector. The TMS9995 Emulator consists of two boards to make up the TMS9995 Emulator board set. The microprocessor control board (PC board PN 2311040-0001) contains the control logic. The other board is the microprocessor interface (UP board PN 2311035-0001) which contains the target cable assembly. The user and installer should read this manual before attempting to operate or install any of the TMS9995 Emulator equipment. If the TMS9995 Emulator board set is removed from the XDS, this manual should be kept with the emulator for reference during future installation.

The following publications are available to support this manual:

SECTION 1

TMS9995 EMULATOR INSTALLATION

1.1 INTRODUCTION

When the TMS9995 Emulator is ordered with the XDS then the emulator boards and the target connector should already be installed. This section should be referenced if the TMS9995 Emulator is not installed or it is to be moved. Also reference this section if the memory option of the TMS9995 Emulator is to be changed.

1.1.1 Board Preparation and Options.

The TMS9995 emulator board set has a memory option that allows its memory size to be increased from 1K bytes to 7K bytes. To incorporate this option, the jumper configurations on the UP and PC boards and memory chips changed on the UP board must be changed as described in the following paragraphs. The TMS9995 Emulator board set is manufactured with the 1KB memory option installed. The jumper configuration should be checked before installing the TMS9995 Emulator board set.

1.1.1.1 Memory Configuration.

The Emulator has a total of 30K bytes of ROM and up to 8K bytes of RAM, both of which reside on the UP Board, while the Address Decode logic for these memories is located on the PC Board. The boards are configured with jumpers so either the smaller 2149 RAM (1Kx4) chips or the larger 2168 RAM (4Kx4) chips can be used. Both the UP and PC Boards have jumpers that are used in configuring the boards for the different memory chips, and both jumpers must be consistent. If one board is jumpered for the 2168 RAM chips, then the other board must also be jumpered for the same chips. The UP Board is manufactured with the 2149 RAM's in place; however, if these chips are ever removed, reinserting them in the board requires some explanation. This is done by moving the UP Board jumper to connect E1 and E2, and by inserting the 2149's into the RAM sockets such that the 2149's pin 1 fits into pin 2 of the socket. The PC Board jumper must be moved to connect E2 and E3. If the 2168 RAM's are inserted, the UP Board jumper must connect E2 to

E3, and the PC Board jumper must connect E1 to E2.

You should check the TMS9995 UP board to see which type of memory chip is installed and set the jumper per Table 1-1. Figure 1-1 shows the jumper pin locations on the TMS9995 PC and UP boards.

Table 1-1 PC Board Jumper Configuration

| Board Type | 1K MEMORY 2149 | 4K MEMORY 2168 |
|------------|-------------------|-------------------|
| PC | E2 - E3 | E1 - E2 |
| UP | E1 - E2 | E2 - E3 |

1.1.1.2 Board Installation.

CAUTION

Power must be turned off before installing or removing circuit boards.

The XDS Model XX Installation and Operation Guide describes the procedure for installing or removing boards from the XDS units. The appropriate manual should be referenced for the model of the XDS being used. If an emulator board or board set currently reside in the XDS, then they must be removed before installing the TMS9995 Emulator board set.

Boards that have been removed from the chassis should be stored so that they are protected from static discharge. Erase the board information on the chassis configuration label for each circuit board that is removed.

For the TMS9995 Emulator board set enter the following information on the chassis configuration label as given in Table 1-2.

Figure 1-1 TMS9995 Emulator Board Set, PC Board

1-3

Figure 1-1 TMS9995 Emulator Board Set, UP Board

15 OCTOBER 1983

1-4

Table 1-2 Chassis Configuration Label Information

| Block Title | Information to be Entered |
|-----------------|--|
| PWB Description | TMS9995 UP |
| Part No | 2311035-0001 |
| Rev | ENTER REVISION LETTER FROM TMS9995 UP BOARD. |
| PWB Description | TMS9995/96 PC |
| Part No | 2311040-0001 |
| Rev | ENTER REVISION LETTER FROM TMS9995 PC BOARD. |

Complete the installation per the appropriate XDS installation and operation guide.

CAUTION

DO NOT OPERATE THE XDS UNIT WITH THE FRONT PANEL REMOVED. THE FRONT PANEL IS REQUIRED FOR PROPER AIR CIRCULATION AND COOLING OF THE CIRCUIT BOARDS. ALSO THE FRONT PANEL IS REQUIRED TO PREVENT LEAKAGE OF RFI/EMI RADIATION.

Restore power to the XDS unit. Allow at least five seconds to elapse after power up before activating the monitor. The monitor may be activated by entering two carriage returns from the terminal keyboard. The screen should display the following:

TEXAS INSTRUMENTS

TMS9995 XDS VERSION 1.3.0

| ? | | | | |

If the monitor does not respond with the proper display, check the installation of the TMS9995 Emulator board set. Refer to the appropriate XDS installation and operation Manual to ensure correct connection to the terminal.

1.1.2 Target Connector.

The target connector is permanently connected to the target cables and does not require additional customer installation. The target connector uses an Auget socket to interface to the target system. A spare socket is supplied with the emulator and should be safeguarded for future use. The target connector should be handled with care at all times.

SECTION 2

OPERATION

2.1 INTRODUCTION

Operation of the emulator is primarily carried out with the emulator software that is referenced in the TMS9995 Emulator User's Guide. The hardware features and connections are discussed in the XDS Installation and Operation Guide. The hardware features are highlighted below:

1. POWER SWITCH: Turns power on to the unit (Model 22 only).
2. POWER LIGHT: Lights when power is applied to the unit.
3. RESET SWITCH: Returns monitor to the control mode.
4. STATUS LIGHTS: Gives emulator status.

The status lights and power requirements are unique for each emulator and are discussed below for the TMS9995 Emulator. The functions of these lights are as follows:

2.2 Status Indicator Lights

The XDS has four status indicator lights that are controlled by the TMS9995 Emulator. The function of these lights are as follows:

1. Status Indicator #1 -- IDLE -- This light comes on when the TMS9995 is in the idle mode, which indicates that the processor is executing an IDLE instruction, (opcode equal >0340). The optional breakpoint/trace board must be installed in the XDS in order for the idle light to operate. The idle indicator resets upon an interrupt acknowledge or when the emulator enters the control mode.

2. Status Indicator #2 -- INTERRUPT REQUEST -- This indicator turns on when a target or decrementer interrupt request is detected and remains on until the interrupt request is cleared or acknowledged.
3. Status Indicator #3 -- HOLD ACKNOWLEDGE -- This indicator turns on when a target hold has occurred and the TMS9995 has acknowledged the HOLD with the HOLDA signal.
4. Status Indicator #4 -- READY -- This indicator comes on when the system (meaning the XDS plus the target system) is in a ready state and turns off when the system is not ready. This indicator is always on if the target cable is not connected to a target system.

2.3 TARGET CONNECTOR

The target connector is installed in the target system in place of the processor to be emulated. The target system can be any circuit which incorporates one or more processors. The target connector pin out and signal characteristics are provided in Section 3.

2.3.1 Handling the Target Connector.

The target connector should be handled with extreme care at all times because the pins are extremely delicate. Take the following precautions when handling the target connector.

1. To prevent an accidental short when connecting or disconnecting the target connector, you should power down the target system and the XDS unit.

NOTE

The XDS may not operate correctly when the target connector is connected to a system that is not powered up.

2. When the target connector is not in use, the pins must be protected to prevent physical damage to the pins and to the XDS unit resulting from electrical short circuits. The pins may be protected by using the gray plastic pin cover supplied with the unit or non-conductive foam. Conductive material should never be used for protecting the target connector pins, since this may cause operation problems with the emulator.

2.3.2 Target Connector Features.

The target connector incorporates the following features to simplify the user's task of working with the target connector and the emulator system:

1. The location of pin 1 is referenced by the yellow dot on the target connector. Figure 2-1 shows the location of the yellow dot with respect to pin 1.
2. Test pins are located on the top of the target connector and correspond one-to-one to the pins that plug into the target system. The exception to this is XTAL1, XTAL2, and VCC. XTAL1 drives an oscillator inside the target housing, XTAL2 drives another input to the same oscillator and VCC supplies power to the oscillator. Pins 1 and 10 on the top of the target connector are open. Pin 2 comes from the oscillator. You should use push-on test probes rather than clips or hooks to access these test pins.
3. A ground connection is provided at each end of the target connector. These mate with the ground cable that is provided with the emulator. This cable screws into the target connector and should be clipped to a ground post on the target system.

NOTE

To ensure a good target system to target-connector ground, the target-connector grounding cable must be properly installed. This is particularly important when operating at high frequencies.

Figure 2-1 Target Connector

15 OCTOBER 1983

2-4

4. The target connector pin interface to the target system is a 40-pin socket. This socket can be removed from the target connector and replaced if a pin is broken. One extra socket is included with the emulator and should be safeguarded for this use. If more replacement sockets are needed, they should be replaced with Auget #540-AG10D.

2.4 POWER REQUIREMENTS

Table 2-1 shows the DC power requirements for the TMS9995 Emulator board set. This information can be used to calculate the total DC power requirements of the XDS system. When adding new boards to the system this DC power calculate should be made to ensure that the XDS power supply will not be overloaded. Refer to the appropriate XDS Installation and Operation Guide for the power supply rating information. The power requirements for the other circuit boards can be obtained from their appropriate reference manuals.

Table 2-1 TMS9995 Emulator Board Set DC Power Requirements

| BOARD PART NUMBER | + 5 Volts (Amps) | + 12 Volts (Amps) | - 12 Volts (Amps) |
|-------------------------|---------------------|----------------------|----------------------|
