

Please do not upload this copyright pdf document to any other website. Breach of copyright may result in a criminal conviction.

This pdf document was generated by me Colin Hinson from a Crown copyright document held at R.A.F. Henlow Signals Museum. It is presented here (for free) under the Open Government Licence (O.G.L.) and this pdf version of the document is my copyright (along with the Crown Copyright) in much the same way as a photograph would be.

The document should have been downloaded from my website <https://blunham.com/Radar>, or any mirror site named on that site. If you downloaded it from elsewhere, please let me know (particularly if you were charged for it). You can contact me via my Genuki email page: <https://www.genuki.org.uk/big/eng/YKS/various?recipient=colin>

You may not copy the file for onward transmission of the data nor attempt to make monetary gain by the use of these files. If you want someone else to have a copy of the file, point them at the website. (<https://blunham.com/Radar>). Please do not point them at the file itself as it may move or the site may be updated.

It should be noted that most of the pages are identifiable as having been processed by me.

I put a lot of time into producing these files which is why you are met with this page when you open the file.

In order to generate this file, I need to scan the pages, split the double pages and remove any edge marks such as punch holes, clean up the pages, set the relevant pages to be all the same size and alignment. I then run Omnipage (OCR) to generate the searchable text and then generate the pdf file.

Hopefully after all that, I end up with a presentable file. If you find missing pages, pages in the wrong order, anything else wrong with the file or simply want to make a comment, please drop me a line (see above).

It is my hope that you find the file of use to you personally – I know that I would have liked to have found some of these files years ago – they would have saved me a lot of time !

Colin Hinson

HEWLETT  PACKARD

CERTIFICATION

The Hewlett-Packard Company certifies that this instrument was thoroughly tested and inspected and found to meet its published specifications when it was shipped from the factory. The Hewlett-Packard Company further certifies that its calibration measurements are traceable to the U.S. National Bureau of Standards to the extent allowed by the Bureau's calibration facility.

WARRANTY AND ASSISTANCE

All Hewlett-Packard products are warranted against defects in materials and workmanship. This warranty applies for one year from the date of delivery, or, in the case of certain major components listed in the operating manual, for the specified period. We will repair or replace products which prove to be defective during the warranty period. No other warranty is expressed or implied. We are not liable for consequential damages.

For any assistance contact your nearest Hewlett-Packard Sales and Service Office. Addresses are provided at the back of this manual.

OPERATING AND SERVICE MANUAL

MODIFICATIONS

SPECIFICATION J12-5245L

ELECTRONIC COUNTER

Specification J12-5245L is a standard ~~CP~~ Model 5245L Electronic Counter with the following modifications:

1. Dual Capacitor C5A and coils L1 and L2 are replaced by a Filtron Co. Inc. No. FA7941 line filter assembly (~~CP~~ Part No. 9100-0353). With this electrical change plus numerous mechanical modifications to provide improved shielding, the counter will meet MIL-I-6181D radiation interference limits when used with a plug-in unit which is modified to meet these same interference limits. If a plug-in is not used, the blank panel should be in place.
2. The AC SIGNAL INPUT and DC SIGNAL INPUT connectors are moved to the rear. The coaxial cable used for this connection increases input capacity by approximately 25 pf and reduces instrument sensitivity to 200 millivolts.

TIME BASE EXT connector J3 is moved to the rear panel. The 0.1 Hz to 1 MHz output frequencies normally available from this connector is still available but may be reduced in amplitude. The 1 MHz signal will have a peak-to-peak amplitude of 0.5 volt. Frequencies below 1 MHz will have an amplitude of 1.0 volt peak-to-peak.

3. An additional BNC connector marked FEED THRU is added on the rear. This rear connector is wired through a length of 50 ohm coaxial cable to an added front-panel BNC connector marked FEED THRU. The connector on the rear of the instrument may be used to feed a signal into a plug-in unit by a short BNC to BNC cable. The instrument is supplied with a special thirteen inch 50 ohm cable assembly for making this connection.
4. START and STOP connectors (BNC) are added on the rear. The START connector is wired to pin 27 of plug-in connector J6. The STOP connector is wired to J6 pin 45. These connectors permit rear-panel input to a modified Time Interval Unit such as ~~CP~~ Specification J09-5262A.

In all other respects this instrument is electrically identical to the standard instrument. Therefore, information in the Operating and Service Manuals for the standard instrument also applies to this special instrument.

SERVICE MANUAL

MODEL 5245L ELECTRONIC COUNTER

SERIALS PREFIXED: 716-

This manual applies directly to  Model 5245L Electronic Counters having serial prefix number 716.

SERIAL PREFIXES NOT LISTED

For serial prefixes above 716, a change sheet will be included with the manual. For serial prefixes below 716, refer to Section V.

OPTIONS

This manual with changes described in Section V also applies to Options 02 and 03.

MANUAL CONTENT

This is a Service Manual only. Operating instructions are outlined in a separate Operating Manual. This Service Manual is supplied to help you make best use of your  Model 5245L Electronic Counter. Seven sections of information are included as follows:

Section I is an introduction to the counter. This includes a table of technical specifications.

Section II discusses detailed theory for the circuits used.

Section III outlines a performance check procedure to verify operation.

Section IV lists parts for the counter.

Section V covers available options and manual changes required to backdate this manual.

Section VI contains adjustment and troubleshooting procedures which include a self check.

Section VII provides the circuit diagrams for the counter. These include block diagrams, schematic diagrams, and some waveforms and voltages.

HOW TO ORDER

To order an Operating or Service Manual for your Electronic Counter, contact the nearest Hewlett-Packard Sales and Service Office. Lists are provided at the back of this manual. Give complete 8-digit serial number and name of instrument. Comments and suggestions concerning this manual are welcome at any Sales and Service Office.

SECTION I

GENERAL INFORMATION

1-1. INTRODUCTION.

1-2. DESCRIPTION.

1-3. The HP Model 5245L Electronic Counter is a high-frequency general-purpose electronic counter. The Model 5245L measures frequencies from 0 to 50 MHz, periods from 1 μ sec to 10 seconds, period averages from 10 to 100,000 periods, the ratio of two frequencies, and the multiplied ratio of two frequencies.

1-4. The HP Model 5245L provides these additional features:

a. Decade scaling to 10^9 for any frequency to 50 MHz.

b. Standard output frequencies from 0.1 Hz to 10 MHz in decade steps.

c. Four-line, binary-coded-decimal output to drive digital recorder (HP Model 562A), digital to analog converter (HP Model 580A/581A), remote readout, or data processing equipment (1-2-2-4 code; 1-2-4-8 code available; see Section V).

d. Display storage which permits reading to be displayed while new count is made.

e. Remote control by external contact closure available (see Section V).

f. Eight-digit display using rectangular (narrow) digital display tubes; decimal point position and measurement units displayed automatically.

g. Operation with plug-in units which extend the basic range and performance of the counter.

1-5. The Model 5245L features solid state design, low power consumption, small size (5-1/4 inch panel height), light weight (32 lb), easy conversion for rack mounting, and modular plug-in circuit boards for simplified maintenance.

1-6. INSTRUMENT IDENTIFICATION.

1-7. Each Model 5245L is identified by a two-section, eight-digit (000-00000) serial number on the rear panel. The five-digit number is an identification number unique to each instrument, and the three-digit number is a serial prefix number, used to document changes.

1-8. All instruments with the same serial prefix are the same. The group of instruments to which this manual applies directly is identified on the title page. For older instruments (lower serial numbers), make manual changes listed in Section V. For newer instruments, having serial numbers higher than those listed on the title page, a Manual Change sheet is included, describing the required changes. The manual for an instrument having special electrical modification will include an insert sheet describing that modification. If a change sheet or special information sheet is missing, the information can be supplied by any Hewlett-Packard sales and service office listed at the back of this manual.

1-9. INSTALLATION AND OPERATION.

1-10. Installation and operation procedures are covered in Sections II and III of the Model 5245L Operating Manual. An explanation of the Counter's controls and connectors and a self-check procedure is included in Section VI of this manual (see Figures 6-1, 6-2, and 6-3).

Table 1-1. Specifications

FREQUENCY MEASUREMENTS

Range: 0 to 50 MHz (dc input). 25 Hz to 50 MHz (ac input, maximum sensitivity).

Gate Time: 1 μ sec to 10 seconds in decade steps.

Accuracy: ± 1 count \pm time base accuracy

Reads In: kHz or MHz with positioned decimal point; units annunciator in line with digital display.

Self Check: counts 10 MHz for the gate time chosen by the time base selector switch.

SCALING

Frequency Range: 0 to 50 MHz.

Factor: by decades up to 10^9 , switch selected on rear panel.

Input: front panel, Signal Input.

Output: in place of time base output frequencies.

PERIOD AVERAGE MEASUREMENTS

Range: Single Period 0 to 1 MHz
Multiple Period 0 to 300 kHz

Periods Averaged: 1 period to 10^5 periods in decade steps.

Accuracy: ± 1 count \pm time base accuracy \pm trigger error.*

Frequency Counted:

1 and 10 period 1 Hz to 10 MHz in decade steps
100 period 10 Hz to 10 MHz
1,000 period 100 Hz to 10 MHz
10,000 period 1 kHz to 10 MHz
100,000 period 10 kHz to 10 MHz

Reads In: sec, ms, μ s, with positioned decimal point; units annunciator in line with digital display.

Self Check: Gate time is 10 μ s to 1 sec (periods averaged of 100 kHz); counts 100 kHz from the time base.

RATIO MEASUREMENTS

Displays: (f_1/f_2) times period multiplier.

Range: f_1 - 0 to 50 MHz. f_2 - 0 to 1 MHz in single period. 0 to 300 kHz in multiple period; periods averaged 1 to 10^5 in decade steps.

Sensitivity: 0.1 v rms, each input.

* Trigger error is less than $\pm 0.3\%$ of one period \div periods averaged for signals with 40db or better signal-to-noise ratio.

** After 72 hours of continuous operation.

Accuracy: ± 1 count of $f_1 \pm$ trigger error* of f_2 . f_1 is frequency applied to the decimal counters (enters Time Base Ext. jack on front panel); f_2 is frequency applied to decade dividers (enters Signal Input jack).

Reads In: Dimensionless; positioned decimal point for number of periods averaged.

Self Check: Period Average Self Check applies.

TIME BASE

Frequency (internal): 1 MHz.

Stability: Aging Rate - less than 3 parts in 10^9 per 24 hours. ** As a Function of Temperature: less than ± 2 parts in $10^{10}/^\circ\text{C}$ -20°C to $+55^\circ\text{C}$. As a Function of Line Voltage: less than ± 5 parts in 10^{10} for $\pm 10\%$ change in line voltage from 115v or 230 v rms.

Short Term - less than 2 parts in 10^{10} rms with measurement averaging time of one second under constant environmental and line voltage conditions.

Adjustment: Fine frequency adjustment (range approximately 4 parts in 10^8) and medium frequency adjustment (range approximately 1 part in 10^6) are available from the front panel through the plug-in hole. Coarse frequency adjustment (range approximately 1 part in 10^5) is available at the rear of the instrument.

Output Frequencies:

Rear Panel: 0.1 Hz to 10 MHz in decade steps; switch selected on rear panel; all frequencies available in manual function without interruption at reset except 100 Hz, 10 Hz, 1 Hz, and 0.1 Hz which are interrupted by manual reset; 10 kHz to 10 MHz available continuously in all functions; 1 kHz available continuously for all functions except 100K period average; stability same as internal time base; 5 volts p-p rectangular wave with 1000 ohm source impedance at 1 MHz and lower; 1 volt rms sine wave with 1000 ohm source impedance only at 10 MHz.

Front Panel: 0.1 Hz to 1 MHz in decade steps; selected by Time Base switch; availability as defined under Output Frequencies above; stability same as internal time base; 1 v p-to-p.

External Standard Frequency: 1 MHz, 1 volt, rms, into 1000 ohms required at rear panel BNC connector.

GENERAL

Registration: 8 digits in-line with rectangular Nixie[®] tubes and display storage; 99,999,999 maximum display; total width of 8 digit display including illuminated units annunciator and auto-positioned decimal point indication does not exceed 7 inches.

® Burroughs Corporation

Table 1-1. Specifications (cont'd)

GENERAL (continued)

Display Storage: Holds reading between samples; switch overrides storage.

Sample Rate: Time following a gate closing during which the gate may not be reopened is continuously variable from less than 0.2 sec to 5 seconds in frequency mode, independent of gate time; display can be held indefinitely.

Operating Temperature Range: -20°C to +65°C.

Connectors: BNC type except for BCD output and power cable.

Signal Input:

Maximum Sensitivity - 100 mv rms.

Attenuation - Step attenuator provides ranges of 0.1, 1, and 10 volts rms.

Trigger Level Adjustment - Front panel control has ±0.3 volt trigger level range on 0.1 volt position, ±3 volt range on 1 volt position, and ±30 volt range on 10 volt position. A preset position automatically centers trigger level at zero volts for all positions of attenuator.

Impedance - 1 megohm in parallel with approximately 25 pf, all ranges.

Coupling - ac or dc, separate BNC connectors. AC coupling has 600 vdc, 0.022 μf capacitor (-3 dB at approximately 7 Hz).

Overload Protection - Diode clamps protect input circuit for up to 120 volts rms on 0.1 volt range, 250 volts rms on 1 volt range, and 500 volts rms on 10 volt range. Input resistance under overload conditions (approximately tentimes minimum sensitivity) will be greater than 100K ohms on 0.1 volt range, and approximately 1 megohm on other ranges.

Time Base External Input (Front Panel):

Maximum Sensitivity - 100 mv, rms.

Impedance - 10K ohms, approximately 20 pf. DC coupled.

Overload - Diode clamps protect input circuit for up to 120 volts, rms.

Output:

4-line BCD 1-2-2-4, "1" state positive. 4-line BCD 1-2-4-8, available as Option 02 ("1" state positive) and Option 03 ("1" state negative).

"0" State Level: -8v.

"1" State Level: +18v.

Impedance - 100K, each line.

Reference Levels:

Approximately +17v, 350 ohm source.

Approximately -6.5v, 1000 ohm source.

Output is suitable for systems use or output devices such as *hp* Model 580A and 581A Digital-to-Analog Converters and includes the decimal point and measurement unit for *hp* 562A Digital Recorder.

Print Command - +13v to 0v step, dc-coupled.

Cable Connector - Amphenol 50-pin 57-30500, 1 required.

Hold-off Requirement - +15v min., +25v max. from chassis ground (1000 ohm source).

Weight - Net 32 lbs (14, 4 kg) with blank plug-in; shipping, 40 lbs (18, 2 kg).

Power Supply - 115 or 230 volts ±10%, 50 to 60 Hz; 95 watts (50 to 1000 Hz operation, special order).

Accessories Furnished - *hp* 10503A Cable, 4 feet long, male BNC connectors. Detachable power cord, 7-1/2 ft (2040 mm) long, NEMA plug. Circuit Board Extender.

Dimensions:

OPTIONAL AND SPECIAL FEATURES

Option 02: 4-line BCD 1-2-4-8, "1" state positive in lieu of 1-2-2-4 (identical in other respects to above Output data) for digits only.

Option 03: 4-line BCD 1-2-4-8, "1" state negative in lieu of 1-2-2-4 (identical in other respects to above Output data) for digits only.

Remote Operation: All functions which may be programmed from the front panel controls (in normal use) may be programmed from a remote location except for the "Sample Rate" (as defined above) and the sensitivity control setting. The instrument provides (through rear panel connectors) all voltages necessary for remote control. The programming voltages for Time Base and Function control are low level, -15 volts dc at 5 ma per gate. Control may also be achieved by using an external -15 volt dc supply. The position of the decimal point and measurements unit may be correctly illuminated from the remote location, using +170 volts dc from the internal or an external supply.

Cable Connector: Amphenol 36-pin 57-30360, 2 required.

SECTION II

PRINCIPLES OF OPERATION

2-1. INTRODUCTION.

2-2. This section describes how the Model 5245L operates. Basic circuits used in the counter are described first (Paragraphs 2-3 through 2-24). Operation of decimal counters and decade dividers is thoroughly discussed in Paragraphs 2-25 through 2-35. A discussion of basic counter functions is given next (Paragraphs 2-36 through 2-43). Pulse timing circuits and overall operation of the entire counter are discussed in Paragraphs 2-44 through 2-50. At the end of the section each assembly is described in order of its assembly designation (A_) (Paragraphs 2-51 through 2-122.)

2-3. THE DIODE.

2-4. GENERAL. Semiconductor diodes are used in signal-handling circuits and in power supply rectifier and regulator circuits.

2-5. THE "OR" GATE. Two or more diodes are sometimes used as an OR gate. The OR gate is a multiple-input circuit which requires only one input to produce an output. Figure 2-1A shows some OR gate configurations.

2-6. THE "AND" GATE. The AND gate or coincidence circuit is a multiple-input circuit which requires the presence of all input signals to produce an output. Figure 2-1B shows an AND gate configuration in which an input signal is passed only when a properly polarized control voltage is applied.

2-7. THE "INHIBIT" GATE. The signal normally passes through an INHIBIT gate; adding a second signal closes the gate and prevents the signal from going through. One of the most common forms of the INHIBIT gate is the series gate shown in Figure 2-1C. If the diode is biased off, the gate is closed, and pulses do not reach the decade divider or decimal counter; when the diode is biased on, the pulses go through the gate and reach the decade divider or decimal counter.

2-8. LIMITER OR CLIPPER. The limiter or clipper is a circuit which removes positive or negative peaks of waveforms. It can be used either as a waveform shaping circuit or as a protective device to prevent excessive voltages from reaching a sensitive circuit. Figure 2-1D shows a limiter which prevents the negative peak of a pulse from going more negative than about -0.6 volt. Note that for a conducting silicon diode the cathode voltage is about 0.6 to 0.8 volt more negative than the anode.

2-9. CLAMPER OR DC RESTORER. The clamper or DC restorer is a circuit which establishes either the positive or negative peak of a waveform at a particular DC reference voltage; in other words, it provides a definite baseline voltage for the waveform. Figure 2-1E shows a clamper which provides a baseline of about +20 volts for a negative pulse.

2-10. REGULATOR. A diode regulator uses either the constant reverse-bias breakdown voltage characteristic of a breakdown diode or the constant forward-bias voltage drop characteristic of a silicon diode. Power supply reference voltages are generally provided by breakdown diodes which maintain a constant voltage when supplied with a reverse-bias voltage greater than their specified breakdown voltage. Regulated voltages can also be provided by a forward-biased silicon diode which maintains a constant 0.6 to 0.8 volt drop. Figure 2-1F shows connections for both types of diodes.

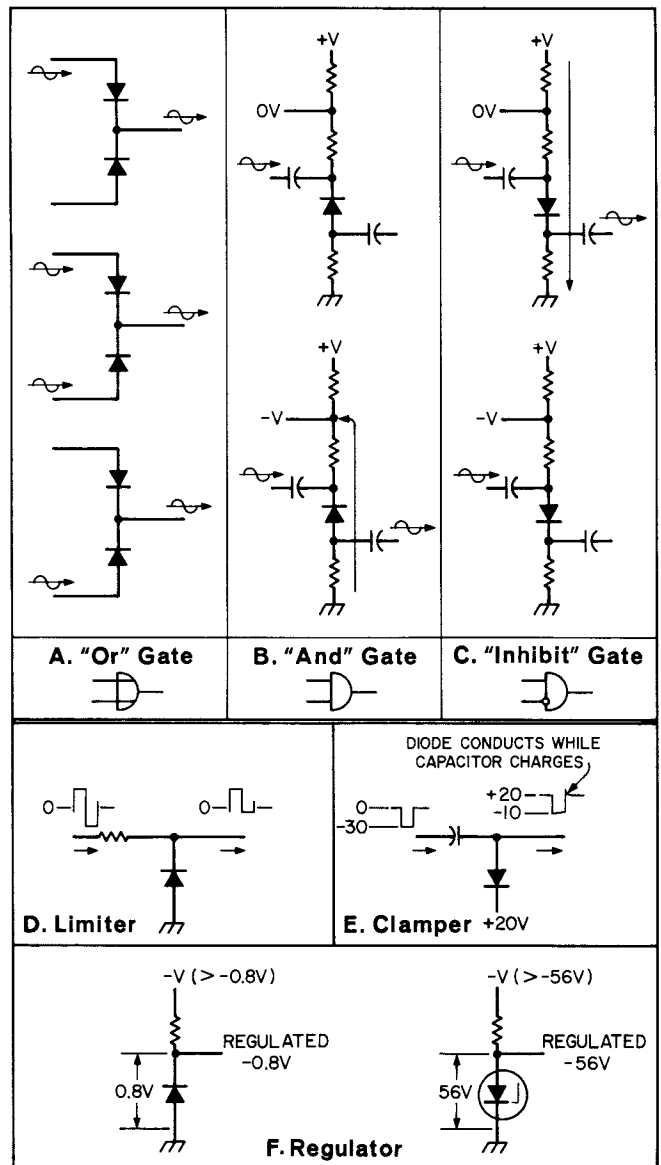

Figure 2-1. Basic Diode Circuits

2-11. THE TRANSISTOR.

2-12. GENERAL. Transistors are used throughout the counter in circuit configurations such as the amplifier, the flip-flop or binary, the trigger circuit, and the one-shot multivibrator. In the following paragraphs, basic transistor operation and a few basic transistor circuits are discussed. These paragraphs discuss the easily observed changes in currents and voltages in transistor circuits which help technicians locate circuit faults but do not attempt to describe how transistors work internally.

2-13. BIASING AND CONDUCTION. In a transistor a small base-to-emitter current controls a large collector-to-emitter current. A comparison of NPN transistor and PNP transistor operation is shown in Figure 2-2B; indicated current represents conventional flow of positive charges external to the transistor and is not intended to indicate flow of carriers inside the transistor structure. Notice that the effect of emitter-base-collector voltages is totally reversed between NPN and PNP transistors; circuits which are arranged for an NPN transistor usually function normally for a PNP transistor if supply voltages are reversed.

2-14. AMPLIFIERS. Three basic amplifier types are available (Figure 2-2A). These amplifiers may be used alone or in combination to form complex circuits.

2-15. FLIP-FLOP. The flip-flop is a bi-stable two-transistor circuit in which one transistor conducts, holding the other cut off. Each input pulse causes a reversal of states; that is, the cut off transistor is turned on and the conducting transistor is cut off. In the flip-flop shown in Figure 2-3A, Q1 is initially conducting heavily; its collector voltage is only slightly negative; a near-zero voltage is supplied to the base of Q2 (junction of R27-28 divider). The voltage drop across R24 produces a sufficiently negative voltage at the emitter of Q2 to hold Q2 cut off. With Q2 cut off the R18-R19-R20 divider delivers a negative voltage to the base of Q1 to keep it conducting.

2-16. At time t_1 the positive input pulse cuts off Q1; the Q1 collector voltage goes negative and drives Q2 into conduction (R27-R28 divider to Q2 base); the Q2 collector voltage and the Q1 base voltage (R19-R20 divider) then become considerably less negative, permitting Q1 to remain cut off. The R26-R27-R28 divider delivers a sufficiently negative voltage to the base of Q2 to drive it into conduction. In a similar manner the positive input pulse at time t_2 cuts off Q2 and starts a sequence of events which ends with Q1 conducting and Q2 cut off. Note that a positive input pulse has no effect on Q1 if it is already cut off. A negative reset pulse applied to the base of Q1 returns the flip-flop to its initial condition (Q1 conducting, Q2 cutoff). The diode CR9 removes the negative pulse from the differentiated square wave input. Without this diode, the negative pulse would drive Q1 which is cut off and the stage would switch from one state

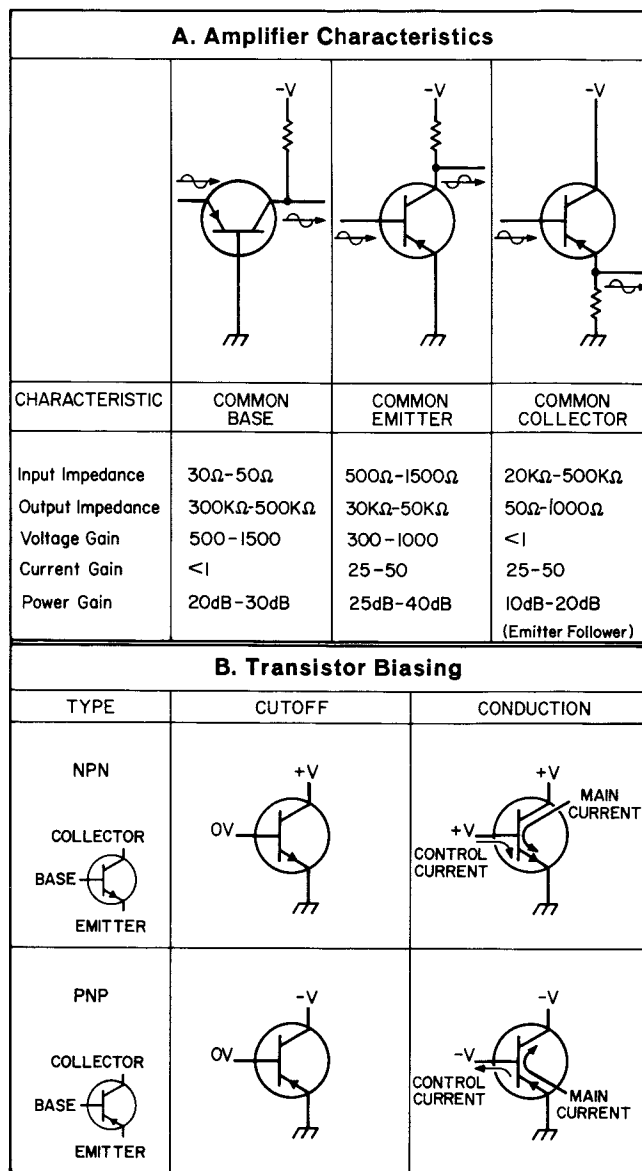

Figure 2-2. Transistor Operation

to the other but would not divide by two. The AC coupling through C2 and C3 insures fast switching. The DC coupling through R19 and R27 insures bi-stable characteristics.

2-17. BINARY CIRCUIT. In this manual a flip-flop which completes its operating cycle and produces an output pulse after receipt of two similar input pulses is called a binary circuit, since it is a counting device in a binary system. The binary circuit is driven from a single input which is connected either through a pair of resistors or through a pair of gating diodes to each transistor base.

2-18. TRIGGER CIRCUIT. The trigger circuit is a limiter or squaring circuit which produces an output waveform with very fast rise and fall times. The

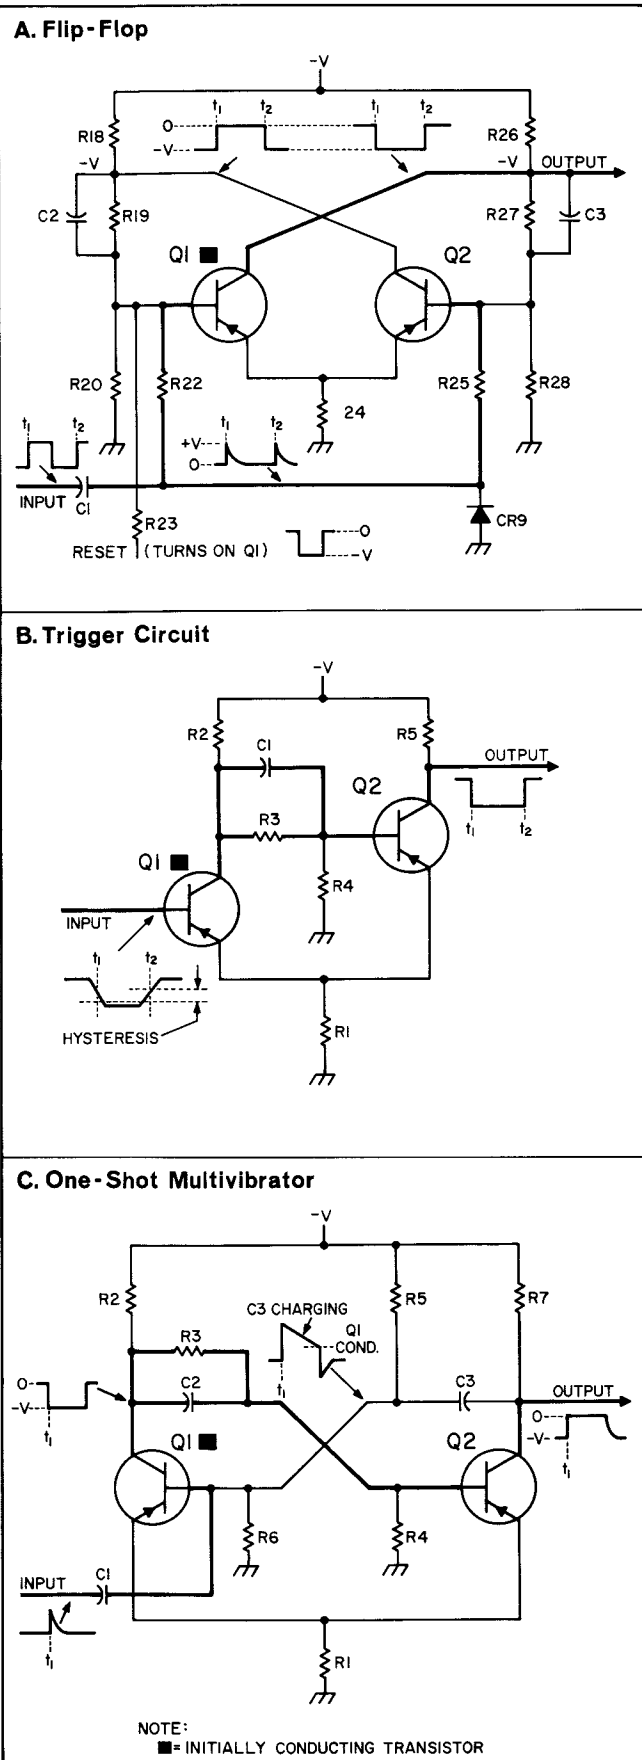

Figure 2-3. Basic Transistor Circuits

trigger circuit is similar to the flip-flop except that the RC network in one half is replaced by the input signal. Capacitor C1 bypasses R3 to couple fast changes in voltage at the Q1 collector to the base of Q2. Either Q1 or Q2 can conduct depending on the voltage at the input. Note that there is a slight difference in input voltage (called hysteresis) between switching with a negative-going input (time t_1) and switching with a positive-going input (time t_2).

2-19. ONE-SHOT MULTIVIBRATOR. The one-shot multivibrator is a circuit which generates a pulse of some specified duration following the application of a suitable triggering pulse. The circuit is similar to the flip-flop except one DC coupling path has been removed so the circuit is stable only in the state with Q1 conducting.

2-20. In the typical one-shot multivibrator shown in Figure 2-3C the following conditions exist during the initial stable period: the R5-R6 divider delivers a sufficiently negative potential to the base of Q1 to hold Q1 in saturation; the Q1 collector and Q1 emitter are therefore slightly negative; the R3-R4 divider delivers the Q2 base an even smaller negative voltage to hold Q2 cut off.

2-21. The positive triggering pulse at time t_1 reduces conduction of Q1; the resulting negative-going voltage at the Q1 collector is applied to the Q2 base through the R3-R4 divider (C2 bypasses R3 to provide coupling for the rapidly changing voltage at the Q1 collector); Q2 begins to conduct; the resulting positive-going change in Q2 collector voltage is coupled through C3 to the Q1 base to further decrease Q1 conduction. The process is regenerative and quickly results in Q1 being cut off and Q2 being saturated.

2-22. Capacitor C3 now charges at a rate mainly determined by the values of R6 and C3 (main charge path: R1-Q2-C3-R5). When the Q1 base voltage becomes sufficiently negative, Q1 begins conduction; the resulting positive-going Q1 collector voltage is coupled to the Q2 base; the Q2 collector voltage goes negative and is coupled through C3 to the Q1 base to further increase Q1 conduction. The process is regenerative and ends with the circuit in its original quiescent state, Q1 saturated and Q2 cut off.

2-23. FIELD EFFECT TRANSISTOR (FET). Field effect transistors have three terminals: source, drain, and gate which correspond in function to emitter, collector, and base of junction transistors. Source and drain leads are attached to the same block (channel) of N or P semiconductor material. A band of oppositely doped material around the channel (between the source and drain leads) is connected to the gate lead.

2-24. In normal FET operation, the gate-source voltage reverse-biases the PN junction, causing an electric field that creates a depletion region in the source-drain channel. In the depletion region the number of available current carriers is reduced as the reverse-biasing voltage increases, making source-

drain current a function of gate-source voltage. With the input (gate-source) circuit reverse-biased, the FET presents a high impedance to its signal sources (as compared with the low impedance of the forward-biased junction transistor base-emitter circuit). Because there is no input current, FET's have less noise than junction transistors. Figure 2-4 shows the schematic symbol and biasing for N channel and P channel field effect transistors.

signal or the output of the internal oscillator into the frequencies to be counted or frequencies to provide the various gate times. Throughout the following discussion, circuits are referred to as "counters" though the description applies equally to decade dividers. Paragraphs 2-25 through 2-29 cover general operation of the counters with emphasis on counting logic; Paragraphs 2-30 through 2-32 discuss readout circuits; and Paragraphs 2-73 through 2-86 discuss specific decimal counter assemblies and the readout assembly.

Figure 2-4. Field Effect Transistor Operation

2-25. BASIC OPERATION OF DECIMAL COUNTER OR DECADE DIVIDER

2-26. INTRODUCTION. Operation of the decimal counter circuit and the decade divider circuit is similar. The difference between the two is in function. Decimal counter circuits divide the input signal by 10 and actuate the digital display tubes, whereas the decade divider circuits are used to divide the input

2-27. INPUT AND OUTPUT FROM BINARY. Figures 2-5A and 2-5B show a flip-flop connected for operation as a binary circuit (basic flip-flop operation is discussed in Paragraphs 2-15 and 2-16). Positive input pulses go to the bases of both transistors and cause switching by cutting off the conducting transistor. Negative reset pulses go to the base of one transistor and turn it on. Note the letter "A" near one transistor and "Ā" (read as "A bar" or "not A") near the other. The positive-going transition at the collector of the Ā transistor (while switching from A conducting to Ā conducting) provides the input to the next binary circuit.

2-28. CIRCUIT ARRANGEMENT AND COUNT NOTATION. Figure 2-5C is a block diagram of a typical four-binary decimal counter. Notice that the B̄ output is applied to the D, D̄, and C transistors and that the D̄ output is applied only to the C transistor. Each input pulse produces a different combination of conducting and cut-off stages; there are only 10 allowable combinations and each combination represents a decimal digit. Decimal weighting is the decimal value assigned, arbitrarily, to the output of a pair when the plain-letter transistor is conducting.

a. Decimal Count. Decimal weighting used in the Model 5245L counter is shown in Figure 2-5C, immediately above each of the four binary stages. The decimal weight each pair represents is present only when the plain-letter side (A, B, D, or C) is conducting; when the barred-letter side (Ā, B̄, D̄, or C̄) is conducting, the decimal weight is zero. The decimal count can be determined by adding the decimal weighting of the four stages. For example, if the A, B, D, and C transistors are conducting, where A=1, B̄ = 0, D = 4, C = 2, the output is 1 + 0 + 4 + 2 = 7.

b. Binary-coded Decimals. In binary-coded decimal notation, the output is either 1 (when the plain-letter transistor is conducting) or 0 (when the barred-letter transistor is conducting). In binary-coded decimal notation, the order of the binaries is given so that binary-coded decimals can be written with the least significant digit to the right. Thus in the system used in the Model 5245L, the binary-coded decimal notation normally is given in the order DCBA. (Counter binaries are shown in the ABCD order on the schematics and in Figure 2-5C to increase clarity in showing signal flow.) For the decimal count of 7 used as an example in Paragraph a, with D = 1, C = 1, B̄ = 0, A = 1, the binary-coded-decimal number would be 1101.

2-29. SEQUENCE. Figure 2-6 shows the counting sequence for a typical decimal counter. Initially each binary is in the "0" (reset) state (decimal count = 0, DCBA = 0000). The following action takes place when a series of input pulses is applied to the counter.

- a. The first pulse switches A to the "1" state (DCBA = 0001 = 0 + 0 + 0 + 1 = 1).
- b. The second pulse switches A to the "0" state; the output from \bar{A} causes B to switch to the "1" state (DCBA = 0010 = 0 + 0 + 2 + 0 = 2).
- c. The third pulse switches A to the "1" state (DCBA = 0011 = 0 + 0 + 2 + 1 = 3).
- d. The fourth pulse switches A to the "0" state; the output from \bar{A} switches B to the "0" state; the output from \bar{B} switches both D and C to the "1" state; the resulting signal from C is applied to \bar{B} and D to return B to the "1" state and D to the "0" state (DCBA = 0110). Although \bar{D} is connected to C, no switching occurs at C as a result of the final switching of D since C has not fully recovered from its recent switching.
- e. The fifth pulse switches A to the "1" state (DCBA = 0111 = 0 + 2 + 2 + 1 = 5).
- f. The sixth pulse switches A to the "0" state; the output from \bar{A} switches B to the "0" state; the output from \bar{B} switches D to the "1" state (DCBA = 1100 = 4 + 2 + 0 + 0 = 6).
- g. The seventh pulse switches A to the "1" state (DCBA = 1101 = 4 + 2 + 0 + 1 = 7).
- h. The eighth pulse switches A to the "0" state; the output from \bar{A} switches B to the "1" state (DCBA = 1110 = 4 + 2 + 2 + 0 = 8).
- i. The ninth pulse switches A to the "1" state (DCBA = 1111 = 4 + 2 + 2 + 1 = 9).
- j. The tenth pulse switches A to the "0" state; the output from \bar{A} switches B to the "0" state; the output from \bar{B} switches D to the "0" state; the output from \bar{D} switches C to the "0" state (DCBA = 0000). When C becomes "0", \bar{C} produces an output pulse which serves as a carry pulse to a following decimal counter assembly. The counter is now returned to its original count.

2-30. RESETTING TO ZERO. The reset pulse, (negative) is applied to the base of the "0" state transistors (\bar{A} , \bar{B} , \bar{D} , \bar{C}) in each binary circuit. If the "0" state transistor is conducting, the pulse has no effect; if the "0" state transistor is not conducting, the pulse turns it on. Thus the reset pulse ensures that all four "0" state transistors are conducting. Figure 2-7 indicates a decimal counter assembly receiving a reset pulse. The counter is in the decimal "4" state (DCBA 0110) and the reset pulse returns the decimal counter assembly to the decimal "0" state (DCBA 0000). Decade dividers can be reset as required to any desired state, since reset inputs are available at each transistor. Note the difference between a regular input pulse and a reset pulse: a regular input signal is positive, and causes a conducting transistor to cut off; a reset pulse is negative, and causes a cut-off transistor to conduct.

Figure 2-5. Basic Four Binary Counter

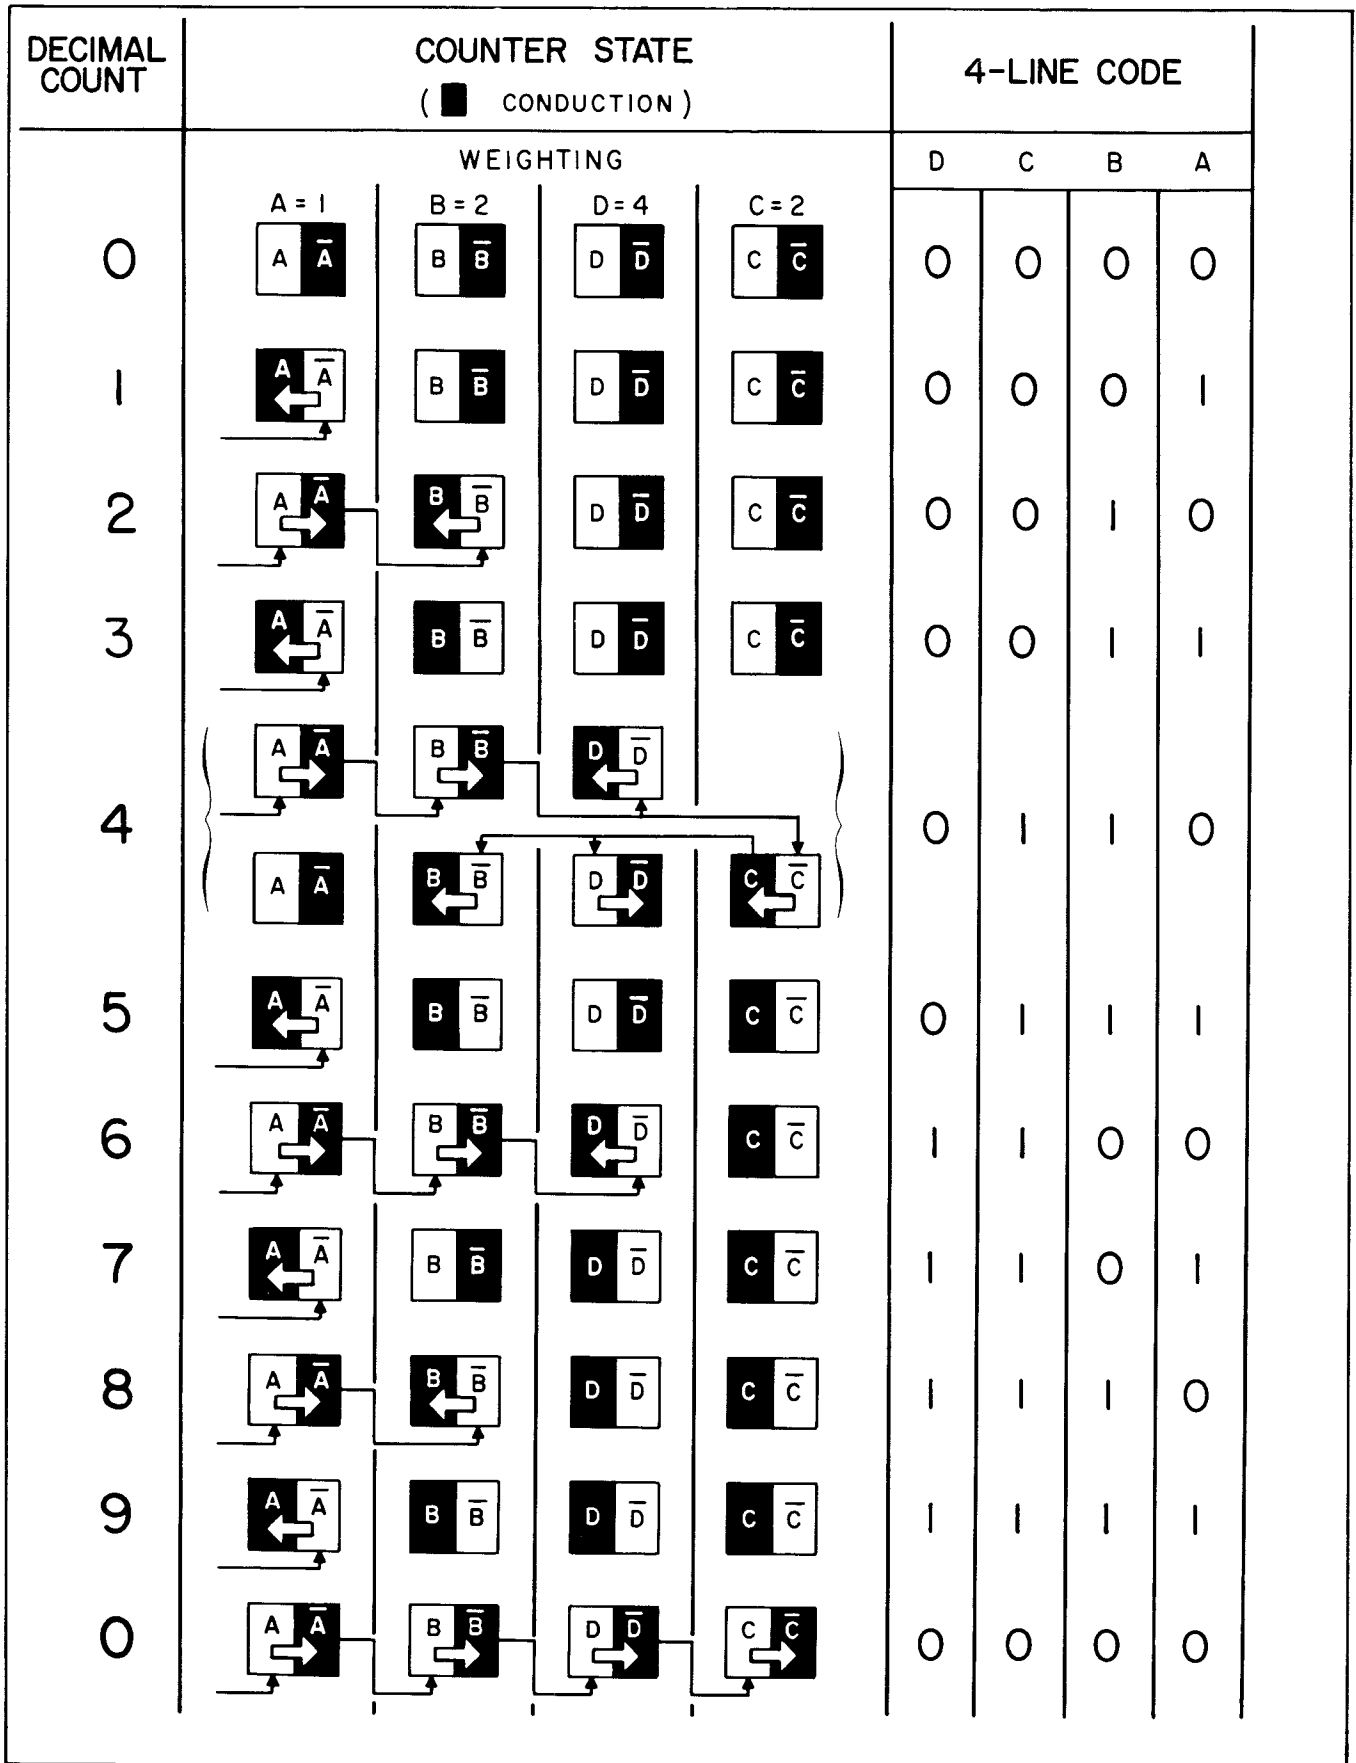

Figure 2-6. Counting Sequence of Four Binary Counter

2-31. Waveforms showing time relationships for the counter are given in Section VII; remember that a driven binary switches only when the input wave is going positive. (Diode clipping removes negative portion of input).

2-32. ELECTRICAL READOUT. A four-line binary-coded-decimal output is available from each decimal counter assembly. A voltage representing the state of each binary is taken from the collector of each of the plain-lettered transistors (A, B, C, and D). A binary "9" is represented by a relatively positive voltage on each line, and a binary "0" is represented by a relatively negative voltage on each line. Table 2-1 summarizes the ten allowable combinations which represent the decimal digits "0" through "9". To protect the binary circuit from being affected by the load, each output line includes a 100K ohm series-connected isolation resistor.

Table 2-1. Four-Line Code Truth Table

Digit	4-Line Code, 0 = negative state 1 = positive state			
	D	C	B	A
0	0	0	0	0
1	0	0	0	1
2	0	0	1	0
3	0	0	1	1
4	0	1	1	0
5	0	1	1	1
6	1	1	0	0
7	1	1	0	1
8	1	1	1	0
9	1	1	1	1

2-33. DIGITAL DISPLAY. A display matrix, consisting of eight neon input lamps and 18 photoconductive elements is used to convert the binary-coded-representation to a digital representation. The display matrix is shown in the Decimal Counter schematics, Figures 7-9, 7-11, and 7-14.

2-34. As indicated in the schematic diagrams, Figures 7-9, 7-11, and 7-14, the circuit to each numeral in the display is brought through three series-connected photocell elements. A characteristic of the photocell element is that it is a high resistance element

(several megohms) when dark and a relatively low resistance element (less than 7000 ohms) when illuminated. Thus when the three photocell elements which constitute a circuit path are illuminated, resistance drops to about 20,000 ohms and sufficient current can flow to light the display digit. Illuminating elements for the photocells are neon lamps, one of which is connected in the collector circuit of each of the eight transistors in the counting circuit; the lamp lights when the transistor conducts. As explained in Paragraph 2-30, a four-binary counting circuit has ten states, ten combinations of conducting and nonconducting transistors, each combination corresponding to one digit. Thus there is a pattern of lighted lamps for each digit. Assigning a binary weight of 1 when the plain-letter lamp (A, B, C, or D) lights, and a weight of 0 when the bar lamp (\bar{A} , \bar{B} , \bar{C} , or \bar{D}) lights, the lamp pattern for any digit can be determined from Table 2-1. Figure 7-9 shows the counting circuit with transistors \bar{D} , \bar{C} , \bar{B} , A conducting. The lamps associated with these circuits illuminate the photocell elements in the circuit to the digit 0 display.

2-35. The circuit sequence required to light a lamp is discussed in the following paragraphs. The sequence discussed will have more meaning if it is remembered 1) that a much higher voltage is required to fire a neon lamp than to maintain illumination in the lamp (for the lamps used in the Model 5245L, 70 volts for firing and 55 volts for maintaining illumination), and 2) that after application of the firing voltage the lamp cannot fire immediately because of the time required for ionization. Arrangement of the binary lamp circuit used in the Model 5245L is indicated in Figure 2-8B. As will be discussed later, diodes connected between the lamps make it possible for the circuit to store a previous count even though the binaries are switching during the next counting period. In decimal counter assemblies which do not have this storage feature, the display changes with each step the binaries take in setting up the circuit for a given digit. To clarify certain aspects of the lamp circuit sequence, the lamp circuit will first be discussed as though there were no diodes between the two lamps of a binary; this circuit is shown in Figure 2-8A.

a. Lamp Circuit without Diodes.

(1) As indicated in Figure 2-8A-1, the lamp associated with the conducting transistor is

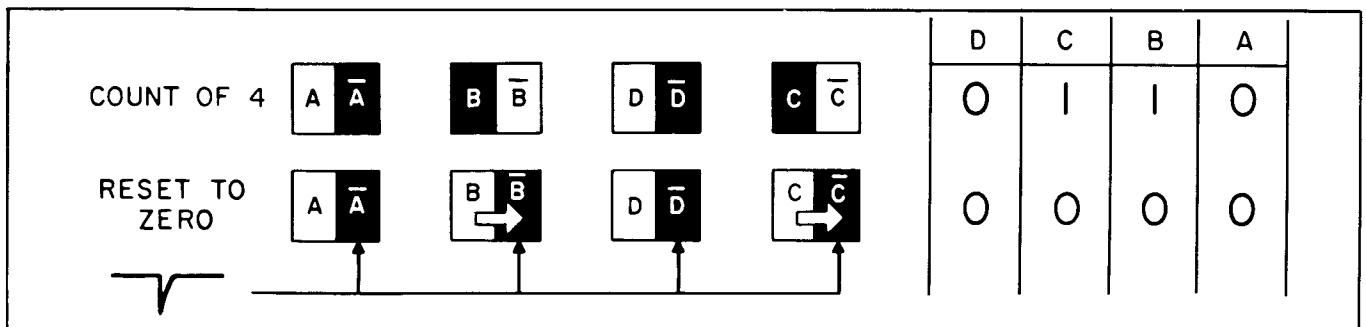

Figure 2-7. Typical Reset Operation in Four-Binary Decimal Counter Assembly

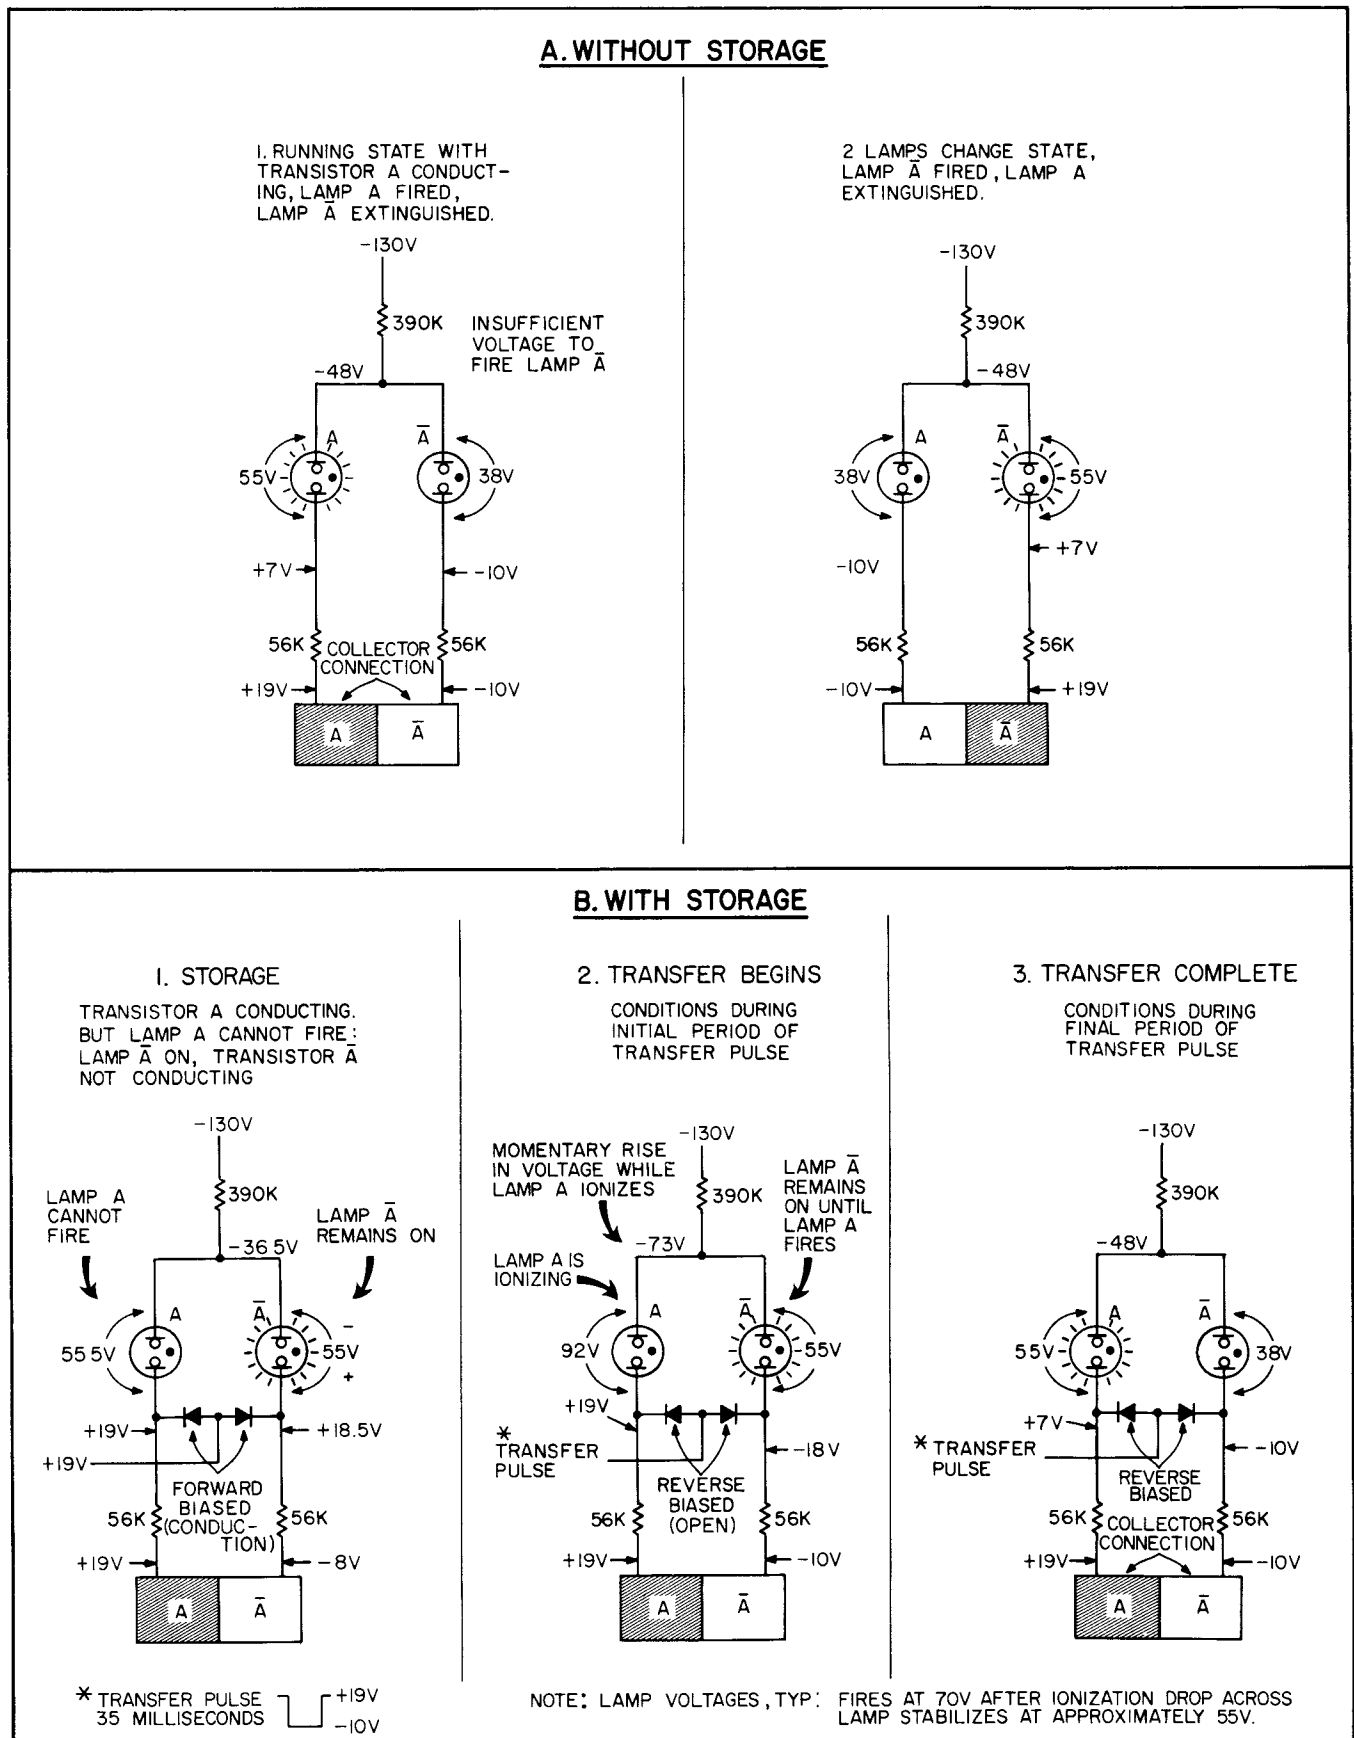

Figure 2-8. Lamp Control

lighted, the lamp associated with the nonconducting transistor is dark. Typically, voltages will be as shown. Since the transistor associated with the dark lamp is not conducting, no current is flowing in the circuit of the dark lamp, and voltage across it is established (a) by the circuit of the conducting lamp and its transistor, and (b) by the voltage on the collector of the non-conducting transistor. This voltage is not high enough to fire the dark lamp.

- (2) When the binary shown in Figure 2-8A changes state, the voltage on the collector of transistor \bar{A} (now conducting) drops to -10 volts, while the voltage on the collector of nonconducting transistor A rises to +19 volts. With transistor A turned off, current through lamp A decreases, and the voltage at the junction of the two lamps rises. Since lamp \bar{A} cannot fire until ionized, voltage will continue to rise until the 70-volt firing level is reached; the junction will reach approximately 73 volts during the ionization period. After the dark lamp fires, the voltage across it stabilizes at about 55 volts, and since the voltage across the other lamp is now reduced to 38 volts, the other lamp extinguishes.
- (3) Circuit state after lamp \bar{A} has fired is shown in Figure 2-8A-2; it is the mirror image of that shown in Figure 2-8A-1.

b. Lamp Circuit with Diodes. The steady, or storage, state of the lamp circuit is indicated in Figure 2-8B-1. The diodes are forward-biased, effectively connecting the lamps in parallel and clamping them to approximately -1.5 volts. One lamp is conducting, the other lamp is dark. Since both lamps are clamped to -1.5 volts, regardless of the state of the binary, there will never be sufficient voltage across the dark light to fire it and it will remain dark until 1) the diodes are reverse-biased and 2) there is conduction through the transistor in whose collector circuit the lamp is connected.

- (1) When the gate closes at the completion of the counting period (see Paragraph 2-95) a -29 volt transfer pulse (see Paragraph 2-99) is applied to the binary diodes, reverse-biasing them. With the diodes reverse-biased, the lamps are disconnected from each other, and the circuit for each lamp is now completed through its associated transistor.
- (2) If the state of the binary is the same as that at the end of the previous counting period, the lamps "see" the voltages required to maintain them without change. If, however, the digit is such that the binary state is changed, the lamps change state. With the diodes reverse-biased, circuit action is the same as that described in subparagraph a. Condition of the circuit during the initial period of the transfer pulse when voltage across the dark lamp is increasing is indicated in Figure 2-8B-2; circuit condition after the lamp has fired is indicated in Figure 2-8B-3.

c. Disabling the Storage. When the function selector is set to MANUAL or the STORAGE switch on the rear panel is in the off position, the storage feature is disabled. Circuit action is then described in subparagraph a.

2-36. BASIC COUNTER FUNCTIONS.

2-37. GENERAL.

a. The basic counter circuits are arranged to provide several functional modes of operation. Each arrangement includes a main AND gate with 1) a signal input and 2) a control input, or gating signal. Following the main gate is a cascaded series of decimal counters which accumulate and display the total number of pulses which pass through the main gate. The various modes of operation are discussed in Paragraphs 2-36 through 2-41.

b. Circuit sequence in the various modes of operation is similar: pulses pass through the main gate to the decimal counters for a predetermined time, are counted and displayed. The difference between arrangements is in 1) the source of the pulses counted, and 2) the source of the gating signal which establishes the length of time during which the main gate is open to pass pulses to the decimal counters.

2-38. TOTALIZING. In the totalizing mode (see Figure 2-9A), the gate flip-flop is controlled by the FUNCTION switch when it is in the MANUAL START or MANUAL STOP positions. The decimal counters count the total number of input pulses applied while the main gate is held open with the FUNCTION switch in the MANUAL START position. Switching the FUNCTION switch to the MANUAL STOP position closes the main gate and the number of pulses which came through the main gate while it was open are displayed.

2-39. FREQUENCY MEASUREMENT. The circuit arrangement shown in Figure 2-9B permits control of the main gate by the counter time base. The gate is opened for a controlled time, therefore the accumulated count represents the number of input cycles or pulses during this time. Controlled intervals are from 10 seconds down to 1 microsecond in decade submultiples, selectable with the front panel TIME BASE switch. The decimal point is automatically positioned and the readout is in kilohertz or megahertz with the units in line with the digital display.

2-40. PERIOD MEASUREMENT. The arrangement shown in Figure 2-9C provides the means for measuring the period of the input signal. The period of a signal is the time required for the completion of one cycle; the counter displays the time in seconds, milliseconds or microseconds. The period measurement is obtained by making the duration of the gating signal equal to the period of the input signal, and counting a train of pulses supplied by the counter time base. The displayed count is the number of time-base pulses which occur during one period of the input signal. For multiple period measurements, Figure 2-9D, the input signal is divided by the selected decade factor so that the gating signal is the selected multiple of one

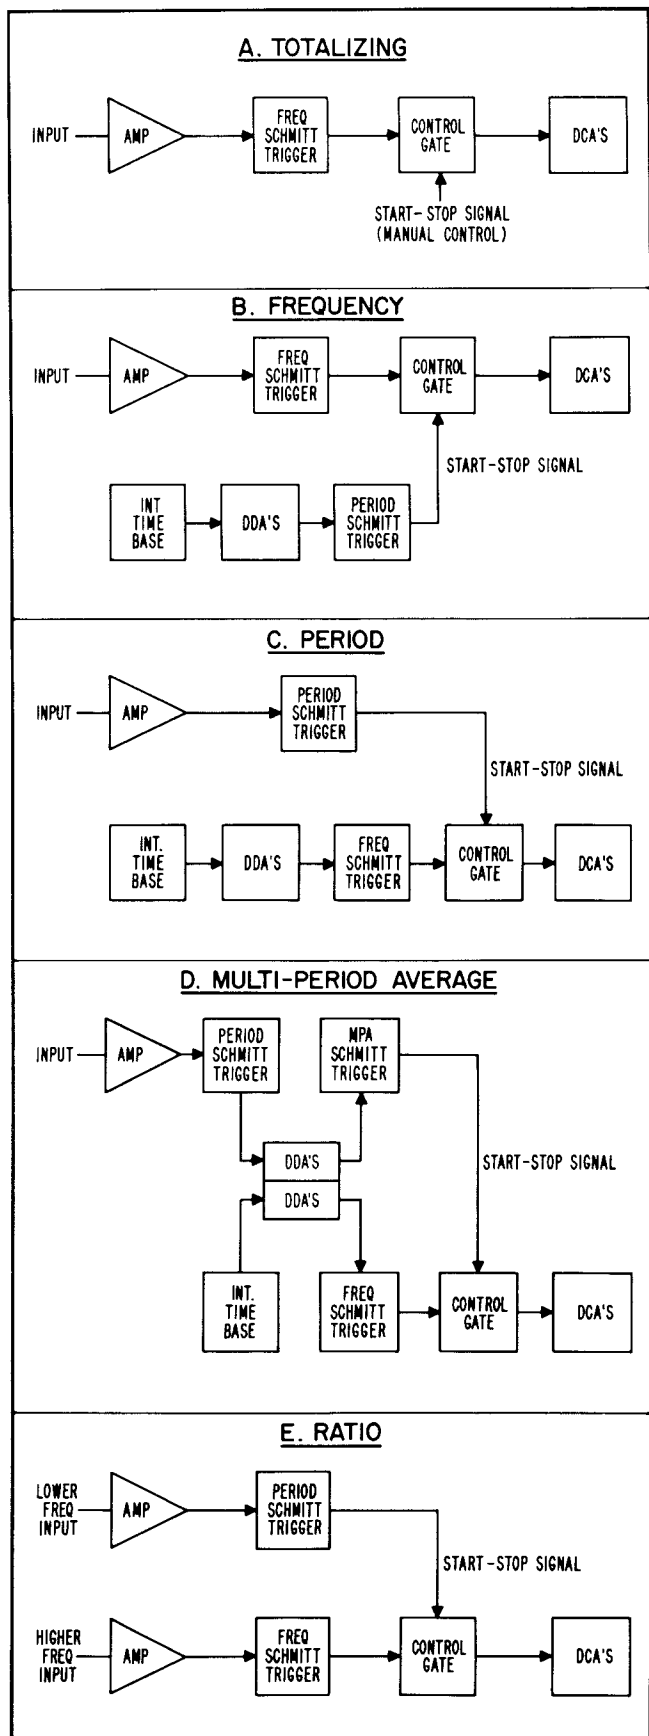

Figure 2-9. Basic Counter Functions

period. The decimal point is positioned to give the readout in seconds, milliseconds or microseconds for a single period of the input signal.

2-41. RATIO MEASUREMENT. As shown in Figure 2-9E, the frequency ratio of two inputs can be measured by a circuit arrangement similar to that used for period measurement. One input signal is applied to the main gate while the gating signal is made equal to the period (or decade multiple of the period) of the other signal. The displayed count represents the number of cycles of one input which occur during the period of one cycle (or decade multiple of one cycle) of the other input.

2-42. STANDARD FREQUENCY OUTPUTS. Multiplier and decade divider circuits connected to the internal 1 MHz oscillator provide output frequencies from 10 MHz to 0.1 Hz (in decade steps) using the arrangement shown in Figure 2-10.

2-43. SCALER OPERATION. An input can be scaled by a factor from 10 to 10^9 (in decade steps) using the arrangement shown in Figure 2-11. Note that the first two divisions are done by the high-speed decimal counters which in this case function as decade dividers.

2-44. TIME SEQUENCE.

2-45. GENERAL. Following a counter measurement there are several operations which occur in a particular sequence. The pulses which control these operations and their time relation to each other are shown in Figure 2-12. The trailing edge of the gating pulse (end of count) triggers the one-shot multivibrators (Paragraph 2-19) which generate these pulses.

2-46. TRANSFER. The transfer multivibrator is triggered at the end of the gating signal, and it produces a 35-millisecond pulse. The transfer pulse is applied to the decimal counters to transfer the new count to the display. During a measurement function the count is stored in the storage binaries until the transfer pulse allows the new count to be displayed.

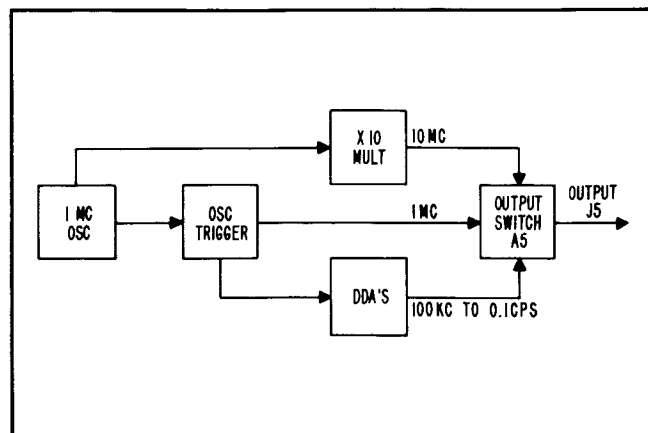

Figure 2-10. Standard Frequency Outputs

Figure 2-11. Scaler Operation

2-47. **SAMPLE RATE.** The sample-rate multivibrator is triggered at the leading edge of the transfer pulse; it produces a pulse which may be varied from 55 milliseconds to 5 seconds with the front panel SAMPLE RATE control. The trailing edge of the sample rate pulse is differentiated to operate the reset amplifier. The reset pulse resets the decimal counters and low-frequency decade dividers.

2-48. **HOLDOFF.** The holdoff multivibrator produces an output pulse which starts at the leading edge of the sample rate pulse and lasts until 55 milliseconds after the end of the sample-rate pulse. The holdoff pulse disables the gate flip-flop to prevent retriggering until the sample rate multivibrator timing capacitor has completed recharging. A sync pulse from the gate control circuit (collector of Q1 through C10 or when in TIME INTERVAL from the start line through CR7 and C11) gives the holdoff pulse a precise length

and prevents the gate flip-flop from being triggered prematurely. During the slight delay between the end of the gating pulse and the start of the holdoff pulse, the gate flip-flop is disabled by an inhibit signal from the transfer multivibrator.

2-49. OVERALL COUNTER OPERATION.

2-50. The entire counter is shown in a logic block diagram in Figure 2-13. The front-panel FUNCTION switch applies a control voltage to selected AND gates in the function control assembly (A21) to arrange circuits for each counter function (see tabulation in Figure 7-2). The front-panel TIME BASE switch arranges the decade dividers (A28-A34) into two groups using gate circuits in the time-base control assembly (A35); the first group produces decade division of the oscillator (A26) output, and the second group produces decade division of the counter input during multiplied period measurements. For details of inter-connections between circuit modules (assemblies) refer to the overall diagram Figure 7-2.

2-51. INPUT SWITCH ASSEMBLY A1.

2-52. The input switch assembly, designated SENSITIVITY (VOLTS RMS) on front panel, is a five-position switch (CHECK, 10, 1, .1, and PLUG-IN). Refer to the schematic diagram, Figure 7-3, for circuit details. Switch functions are listed below.

a. Provides three attenuation steps (X1, X10, X100) for signal applied to the SIGNAL INPUT connector. The attenuator output is connected to the input amplifier A19.

b. Connects output of plug-in unit to input amplifier A19 when switched to PLUG-IN position.

c. Produces gate controls 1, 2, 3, 5, 6, and 27 by combining switched -15 volts from A3 (FUNCTION switch); distinguishes between CHECK and not-CHECK positions.

d. Combines switched -15 volts from A3 to contribute to generation of gate controls 4, 21, 22, 23, 24, 25, 26, 27, 28, and 29; distinguishes between CHECK and not-CHECK positions. Switching for these gate controls is finished in A2 (TIME BASE switch).

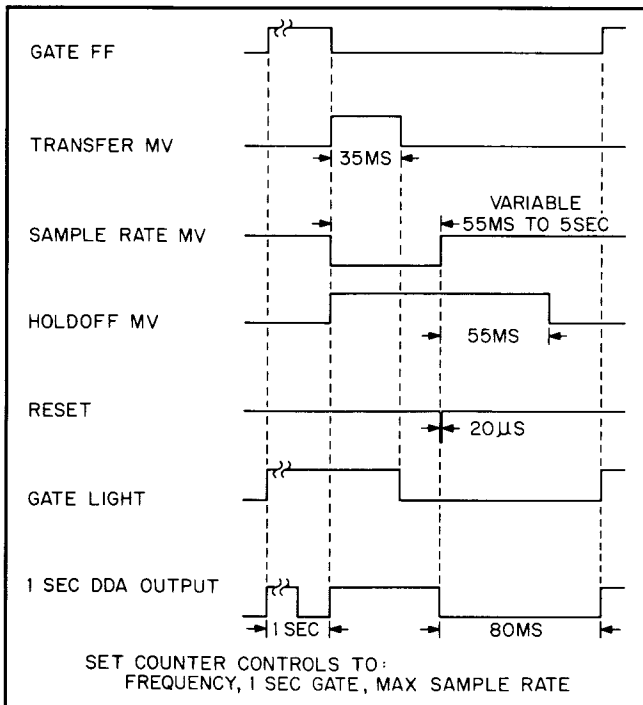

Figure 2-12. Time Sequence

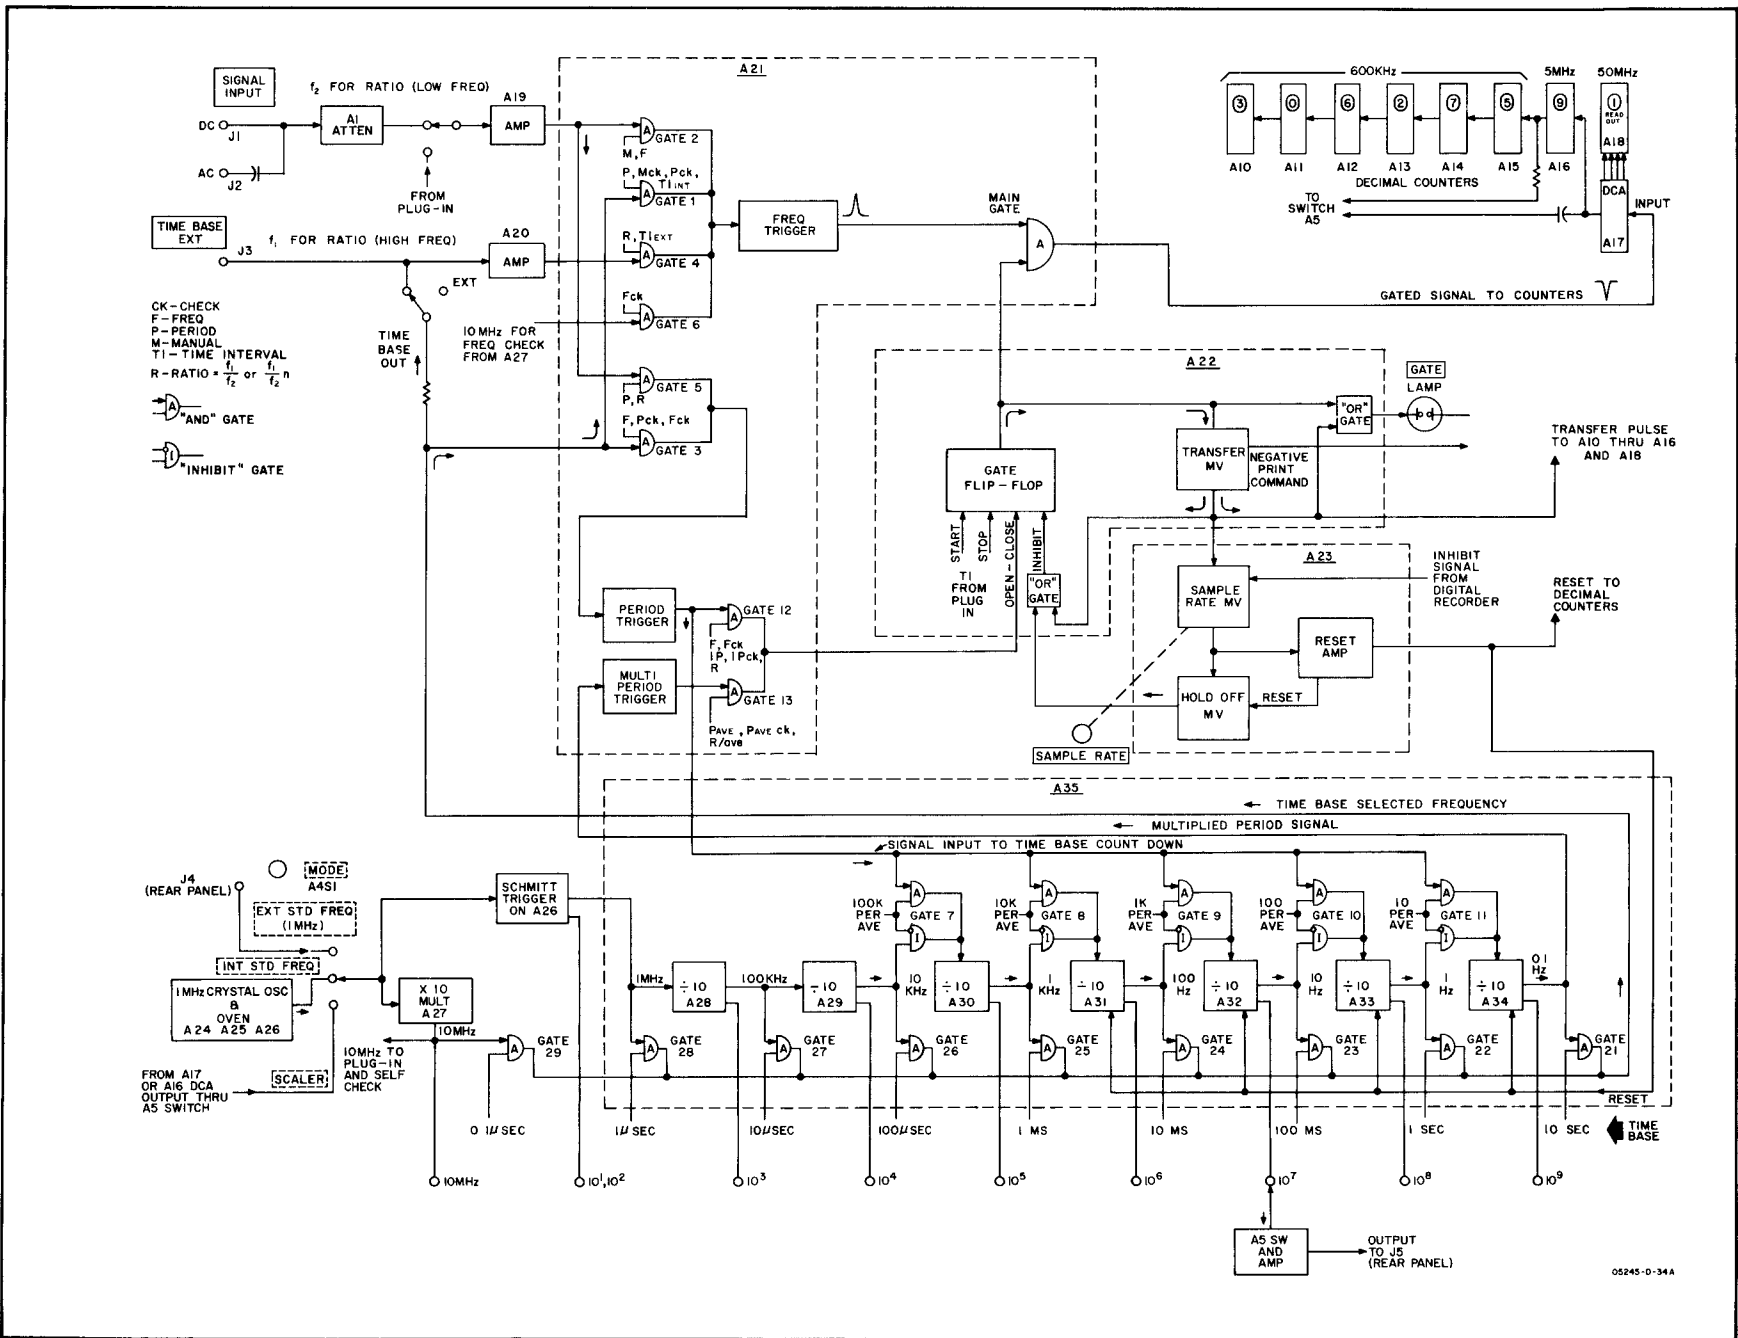

Figure 2-13. Model 5245L Logic Block Diagram

e. Switches +170 volts as first step in generating lamp control voltages (distinguishes between CHECK and not-CHECK positions). Further switching is done by A3, final switching by A2.

2-53. The level control designated -LEVEL+ on the front panel adjusts the dc input trigger level from -0.3 volts dc to +0.3 volts dc. Refer to schematic diagram Figure 7-3 and 7-4 for circuit details. This control allows the trigger level for input signals to be adjusted above or below ground potential. The level control range is increased to ± 3 volts dc when the input sensitivity switch is set at 1 volt rms, and is increased to ± 30 volts dc for the 10 volt rms setting. The maximum counterclockwise position (PRESET) closes a switch which automatically sets the trigger level at ground potential for all attenuator positions.

2-54. TIME-BASE SWITCH ASSEMBLY A2.

2-55. The time-base switch assembly (designated TIME-BASE on front panel) is a 10-position switch (EXT, 10s, 1s, .1s, 10ms, 1ms, .1ms, 10 μ s, 1 μ s, .1 μ s). Refer to the schematic diagram, Figure 7-4, for circuit details. Switch functions are listed below.

a. Produces gate controls 4, 21, 22, 23, 24, 25, 26, 27, 28, and 29 using switched -15 volts from A1 (SENSITIVITY switch).

b. Produces all decimal point control voltages using switched +170 volts from A3 (FUNCTION switch). Decimal point control voltages are connected to appropriate input terminals on decimal point assembly A8.

c. Produces all measurement units control voltages using switched +170 volts from A3. Measurement unit control voltages are connected to appropriate input terminals on measurement units assembly A9.

d. Generates reset pulses by momentarily supplying -15 volts while switch is between detent positions. This resets all counter circuits if time-base selection is changed during a measurement operation. Reset output is connected to manual reset input of sampling control assembly (pin 9 of A23).

e. Connects time-base selected frequency from A21 (function control assembly) to EXT connector on front panel when switch is not in EXT position. Disconnects selected frequency from EXT connector when switch is in EXT position.

2-56. FUNCTION SWITCH ASSEMBLY A3.

2-57. The function switch assembly (designated FUNCTION on the front panel) is a 10-position switch (MANUAL STOP; MANUAL START; FREQUENCY; PERIOD AVERAGE for 1, 10, 100, 1K, 10K, and 100K periods; and REMOTE OR TIME INT). Refer to the schematic diagram, Figure 7-5, for circuit details. Switch functions are listed below.

a. Produces gate controls 7 through 13 by switching -15 volts from power supply.

b. Contributes to generation of gate controls 1 thru 6 and 21 thru 29.

c. Contributes to generation of decimal point and measurement units controls from switched +170 volts from A1 (SENSITIVITY switch).

d. Produces start and stop input voltages (-15 volts) to gate flip-flop in the gate control assembly (pins 13 and 14 of A23) when switched to MANUAL START and MANUAL STOP.

e. Shorts sample-rate trigger pulse to ground at pin 4 of A23 when switched to either MANUAL START or MANUAL STOP. This inhibits operation of the sample rate and holdoff multivibrators, thereby preventing the reset amplifier from operating in MANUAL functions. This arrangement allows the accumulation of counts in the DCA's over several gate openings during MANUAL operation. Reset is still possible in the MANUAL function by use of the RESET push button on the front panel.

f. Opens the transfer-pulse line between the STORAGE switch on the rear panel and the decimal counters when switched to either MANUAL START or MANUAL STOP. This prevents display storage operation.

g. Opens inhibit-signal line between the DIGITAL RECORDER connector on the rear panel and pin 12 of A23 when switched to either MANUAL START or MANUAL STOP. This prevents undesired triggering of the holdoff multivibrator which could inhibit the gate flip-flop.

h. Generates reset pulses by momentarily supplying -15 volts while switch is between detent positions. This resets all counter circuits if function selection is changed during a measurement operation. Reset output is connected to manual reset input of sampling control assembly (pin 9 of A23).

2-58. MODE SWITCH ASSEMBLY A4.

2-59. The mode switch assembly (designated MODE on rear panel) is a three-position switch (EXT STD FREQ 1 MHz, INT STD FREQ, SCALER). Refer to the schematic diagram, Figure 7-6, for circuit details. Switch functions are listed below:

a. Connects external 1-MHz standard to trigger-circuit of the oscillator assembly (A26) when in EXT STD FREQ 1 MHz position.

b. Connects output of internal oscillator to trigger-circuit of oscillator assembly when in INT STD FREQ position.

c. With A5, connects output of first or second decimal counter (A16 or A17) to trigger-circuit of oscillator assembly when in SCALER position.

d. Provides AC ground through bypass capacitor for signals not selected as input for trigger-circuit of oscillator assembly.

2-60. OUTPUT SWITCH ASSEMBLY A5.

2-61. The output switch assembly (designated OUTPUT on rear panel) includes an amplifier stage and a nine-position switch (.1 Hz thru 10 MHz and 10^9 thru 10^{10} in decade steps). Circuit details are shown in the schematic diagram, Figure 7-6. Switch functions are listed below:

a. Provides standard frequency signals at OUTPUT connector from counter time base if MODE switch is not set to SCALER position. Normally provides all frequencies from .1 Hz to 10 MHz in decade steps but frequencies of 100 Hz and below are interrupted when counter is reset, and availability of frequencies of 1 kHz and below depends on setting of FUNCTION switch.

b. Provides scaling of input signals by factor of 10 to 10^9 (in decade steps) at the OUTPUT connector when MODE switch is set to SCALER and FUNCTION switch is set to MANUAL START.

c. Amplifies selected output for all selections (except standard frequencies of 1 MHz and 10 MHz and scaler ratio of 10 and 100; amplifier is disabled by +13 volt bias supplied when these outputs are selected).

2-62. POWER SUPPLY: RECTIFIER ASSEMBLY A6; REGULATOR ASSEMBLY A7.

2-63. GENERAL. Several supplies are included in the 5245L. Their characteristics are tabulated in Table 2-2.

Note

In the following discussion complete reference designations are used to identify components. This is to prevent confusion between reference designations of power-supply components located on the chassis and components located on the rectifier assembly (A6) and regulator assembly (A7). For example, "R1" would refer to a component located on the chassis, while "A7R1" would refer to a component located on the regulator assembly. Complete designations are used when confusion might exist between chassis components and circuit-board components.

Table 2-2. Power Supplies

Supply	Regulated	Remarks
-15 v	Yes	Series reg
+13 v	Yes	Series reg
+20 v	Yes	Series reg
-130 v	No	-150 v ref to +20 v
+170 v	No	+150 v ref to +20 v

2-64. PRIMARY POWER. As shown in Figure 7-7 either 115- or 230- volt AC power is connected through an LC filter (C5A, C5B, L1, L2), fuse F1 and front-panel power switch S3B (part of SAMPLE RATE control) to the primary of power transformer T1 and T2. Moving slide switch S4 on the rear panel to the left exposes "115" and connects the primaries in parallel for 115-volt operation. Moving the slide switch to the right exposes "230" and connects the primaries in series for 230-volt operation. Transformer T1 supplies power for continuous operation of the crystal-oven-heater control circuits; note that turning off the counter does not turn off the power to the crystal oven. Fan motor B1 is connected across a single primary winding; T2 functions as an autotransformer to supply 115-volts to B1 when the instrument is connected for 230-volt operation.

2-65. MINUS 15-VOLT SUPPLY. The regulated -15 volt supply consists of a full-wave rectifier (A6CR1 through A6CR4) whose output is smoothed by filter L3-C6, regulated by Q2, and further filtered by A7C2. The A7R4, A7R5, A7R6 divider supplies a sample of the regulated output to A7Q2 which amplifies and inverts variations in the sample. The A7Q2 output controls driver A7Q1 which in turn controls regulator Q2. Potentiometer A7R5 permits adjustment of the regulated output voltage by providing a means of adjusting A7Q2 bias.

2-66. REGULATOR OPERATION. Operation may be traced as follows: Suppose the output voltage tends to shift toward -14 volts. This causes the voltage at the A7Q2 base to go in a positive direction resulting in a decrease of conduction and a negative swing in A7Q2 collector voltage; driver A7Q1 increases conduction (A7Q1 emitter and Q2 base voltage go negative); regulator Q2 increases conduction and returns the output voltage to -15 volts.

2-67. OTHER REGULATOR COMPONENTS. Break-down diode A7CR1 provides a 6.8-volt reference to the emitter of A7Q2. The A7R1-A7C1 network provides phase correction for stability during transients.

2-68. -130 VOLT AND +170 VOLT SUPPLIES. Two conventional full-wave rectifiers supply unregulated +170 volts and -130 volts. Each rectifier circuit provides a 150-volt output (filtered by C7 and C8), but the circuits are referenced to +20 volts so the actual output voltages (relative to ground) are +170 volts and

-130 volts. Note that the -130 volt supply is the source for shunt regulator A7CR2 which provides -56 volts to the -15 volt regulator circuit.

2-69. +13-VOLT AND +20-VOLT SUPPLIES. The +13-volt supply (Q3, A7Q3, and A7Q4; see schematic Figure 7-7) is similar to the -15 volt supply described in Paragraph 2-65. The only significant difference is that the negative leg is grounded while the positive leg provides the regulated output. The +20 volt supply is obtained by adding a 7 volt source to the +13 volt supply. The 7 volt regulator consists of Q4 and A7Q5, both acting as emitter followers. A 7 volt zener diode and a bias adjustment circuit provide the reference voltage for this supply.

2-70. DECIMAL POINT ASSEMBLY A8.

2-71. INPUT. The decimal point assembly holds eight neon lamps which are located to the left of each digital display tube on the front panel. Lamps are designated 0 through 7 from right to left as seen looking at the front panel. The decimal point control signal consists of +170 volts applied to the desired lamp input. Control is supplied either from the TIME BASE switch or the lower REMOTE CONTROL connector on the rear panel.

2-72. OUTPUT. A group of OR gates converts the decimal point control signal from decimal form to binary-coded decimal (BCD) form which is supplied to the DIGITAL RECORDER connector on the rear panel. As an example, suppose decimal point 5 is lighted; a positive signal passes the OR gates and limiters to the A, B, and C output lines, thus providing a 0111 (in the order DCBA) output to the DIGITAL RECORDER connector. For circuit details refer to the schematic diagram, Figure 7-8.

2-73. MEASUREMENT UNITS ASSEMBLY A9.

2-74. INPUT. The measurement units assembly holds six neon lamps which are located on the front panel at the right end of the counter display. Lamps are designated MC, KC, SEC, mS, μ S, and *(asterisk). As with the decimal point assembly, the measurement units control signal consists of +170 volts applied to the desired lamp input. Control is supplied either from the TIME-BASE switch or the lower REMOTE CONTROL connector on the rear panel.

2-75. OUTPUT. A group of OR gates converts the measurement units control signal from decimal form to BCD form, just as is done in the decimal point assembly. The digit which is printed for each measurement unit is given in a table along with the schematic diagram, Figure 7-8. Print wheels are available for Hewlett-Packard recorders so that the correct measurement units symbol can be printed directly.

2-76. 600 kHz DECIMAL COUNTER ASSEMBLIES A10-A15.

2-77. The decimal counter is shown in block diagram form in Figure 2-14A. The input circuit to binary A includes steering diodes CR9 through CR12. These diodes gate the input pulse so that it is applied only to

the conducting transistor. For example, if the binary is in the "1" state (Q1 cut off, Q2 conducting), CR9 is reversed biased by approximately 30 volts while CR10 is slightly forward biased. The next input pulse is therefore steered to the base of conducting transistor Q2. Note the inclusion of clipper diodes CR13 and CR16 through CR18; they permit only positive pulses to be delivered to the input base of each transistor. In A15 only, CR13 also functions as the main signal gate. Operation of the basic circuits is discussed in the paragraphs listed in Table 2-3. Circuit details are given in the schematic diagram Figure 7-9.

Table 2-3. Basic Operation Summary of Four-Binary Counter

Area	Paragraph Reference
Binary circuit and counting logic	2-25 through 2-29
Resetting	2-30
Electrical readout	2-32
Digital display	2-33 through 2-35
Decimal point	2-70
Clipper diodes	2-8

2-78. 5 MHz DECIMAL COUNTER ASSEMBLY A16.

2-79. The 5 MHz decimal counter operates in a manner similar to the low frequency counter described in Paragraph 2-76. The circuits have been modified by the use of: a) high frequency transistors; b) reduced time constants in the interstage coupling network; and c) steering diodes. The input circuit to binary A includes steering diodes CR9, CR10, CR20, and CR21. These diodes gate the input pulse so that it is applied only to the conducting transistor. For example, if the binary is in the "1" state (Q1 cut off, Q2 conducting), CR9 is reversed biased by approximately 30 volts while CR10 is slightly forward biased. The next input pulse is therefore steered to the base of the conducting transistor Q2. (See Figure 7-11.)

2-80. 50 MHz DECIMAL COUNTER ASSEMBLY A17.

2-81. GENERAL. The 50 MHz decimal counter assembly is shown in Figure 2-16. Operation of basic circuits is discussed in the Paragraphs listed in Table 2-3. Circuit details are given in the schematic diagram, Figure 7-13.

2-82. GATED INPUT. Five AND gates route the input signal to the proper transistor base for each count; feedback is not used. Each of these gates is labeled to indicate the results of an input pulse passed by that gate. For example, the first input pulse is passed by gate A (diode gate A is forward biased by the negative collector voltage of transistor \bar{A}) This negative pulse turns off transistor \bar{A} which turns on transistor A. In the same way gate \bar{A} passes the second pulse turning on transistor \bar{A} . On counts 2, 4, 6, 8, and 0 (10) the input pulse passed by gate \bar{A} is amplified and applied to the inputs of gates B, \bar{B} , and C. Gate B conducts when both an input pulse is present and transistor B is not conducting (this occurs on counts 2 and 8). Gate \bar{B} conducts when both an input pulse is present and transistors \bar{B} and \bar{C} are both turned off (this

Figure 2-14. Decimal Counter and Decade Divider Block Diagram

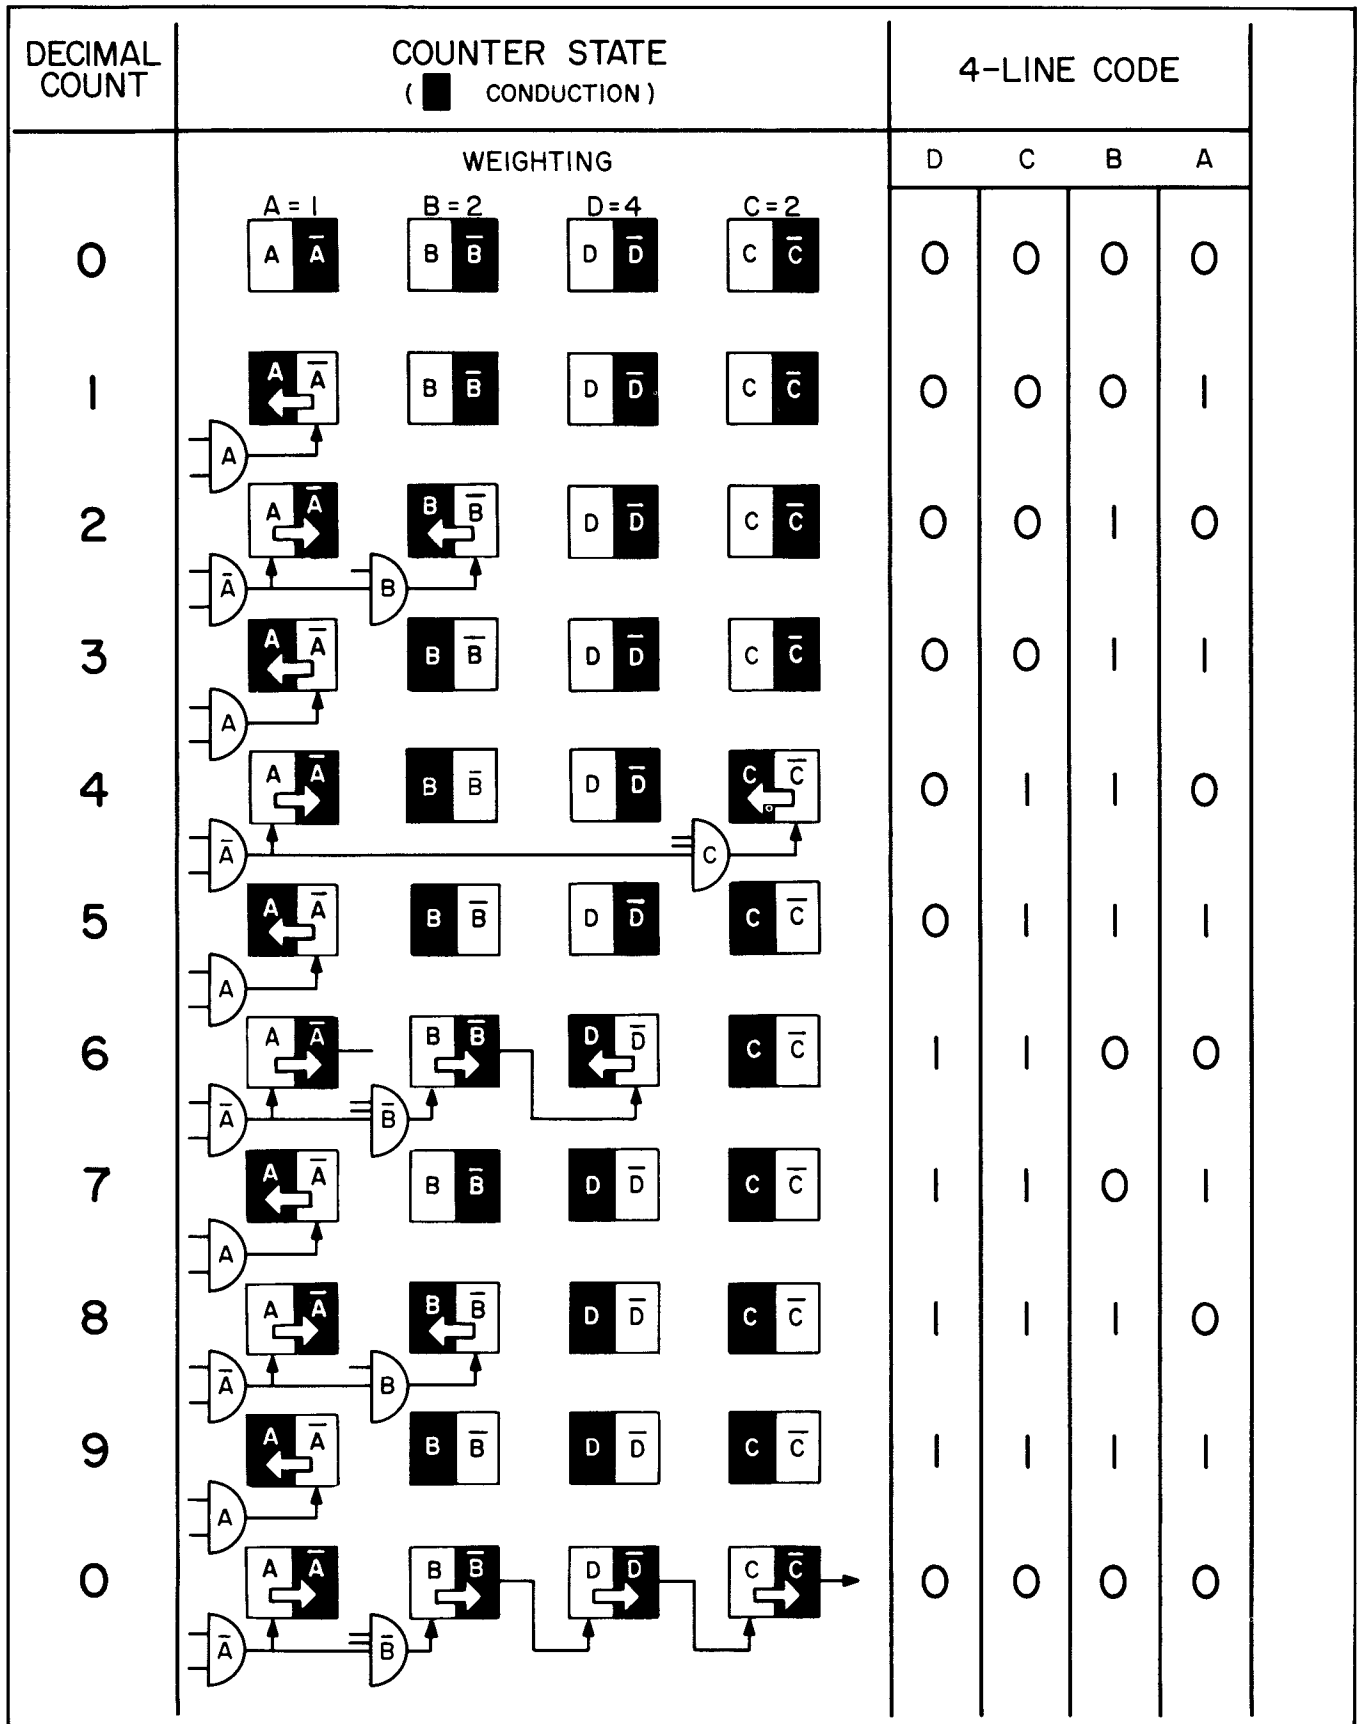

Figure 2-15. 50 MHz Counting Sequence

occurs on counts 6 and 0). Gate C conducts when an input pulse is present and transistors B and C are both turned off (count 4).

2-83. **OUTPUT.** The common emitter amplifier inverts the output and provides the voltage gain necessary to drive the 5 MHz counter assembly.

2-84. 50 MHz READOUT ASSEMBLY A18.

2-85. **GENERAL.** The 50 MHz readout assembly (A18) receives the binary-coded decimal output from the 50 MHz decimal counter A17; it provides both front-panel digital display and amplified binary-coded-decimal signals. Circuit details are shown in the schematic diagram, Figure 7-14.

2-86. **AMPLIFIERS.** Transistors Q1 through Q8 are arranged in four pairs (amplifiers A, B, D, and C). Each amplifier pair controls a pair of neon lamps in the display matrix (for detailed discussion of digital display see Paragraphs 2-33 through 2-35).

2-87. **AMPLIFIER OPERATION.** As an example of amplifier operation, suppose that the A input became relatively negative, equivalent to binary "0", conduction through Q1 would decrease, resulting in a relatively negative voltage at the Q1 emitter and a relatively positive voltage at the Q1 collector, thus permitting the A neon lamp to light; the output of Q1, coupled to Q2 by way of emitter resistor R22 and voltage divider R20-R21, results in conduction of Q2,

the Q2 collector voltage therefore becomes relatively negative, representing binary "0", and is supplied as the A output. Operation is reversed upon receipt of a relatively positive input (binary "1") and results in lighting of the A neon lamp and supplying a relatively positive A output, representing binary "1". The B amplifier (Q3-Q4), the D amplifier (Q5-Q6), and the C amplifier (Q7-Q8) operate in a similar manner.

2-88. INPUT AMPLIFIER ASSEMBLY A19-A20.

2-89. Diodes CR2, CR6, CR4, and CR7 together with current source resistors R25 and R26 provides two low voltage sources that function together with limiting diodes CR1 and CR3 to provide protection while maintaining 1 megohm input resistance up to 2.8 volts peak-to-peak (same voltage as the 4 on diodes). Since the input resistance of the limiting diodes in parallel with the temperature matched field effect transistor (FET) pair is much greater than 1 megohm, the input resistance is determined by the resistors in the attenuator A1.

2-90. The LEVEL control supplies a voltage to the second input without a gain change. Transistors Q2A and Q3 are a standard feedback pair used in differential operation with feedback pair Q2B and Q4. The feedback provides small loading on the source followers, wide bandwidth, and stable gain. The second differential pair provides gain with temperature stability and is a current source to drive the twisted pair

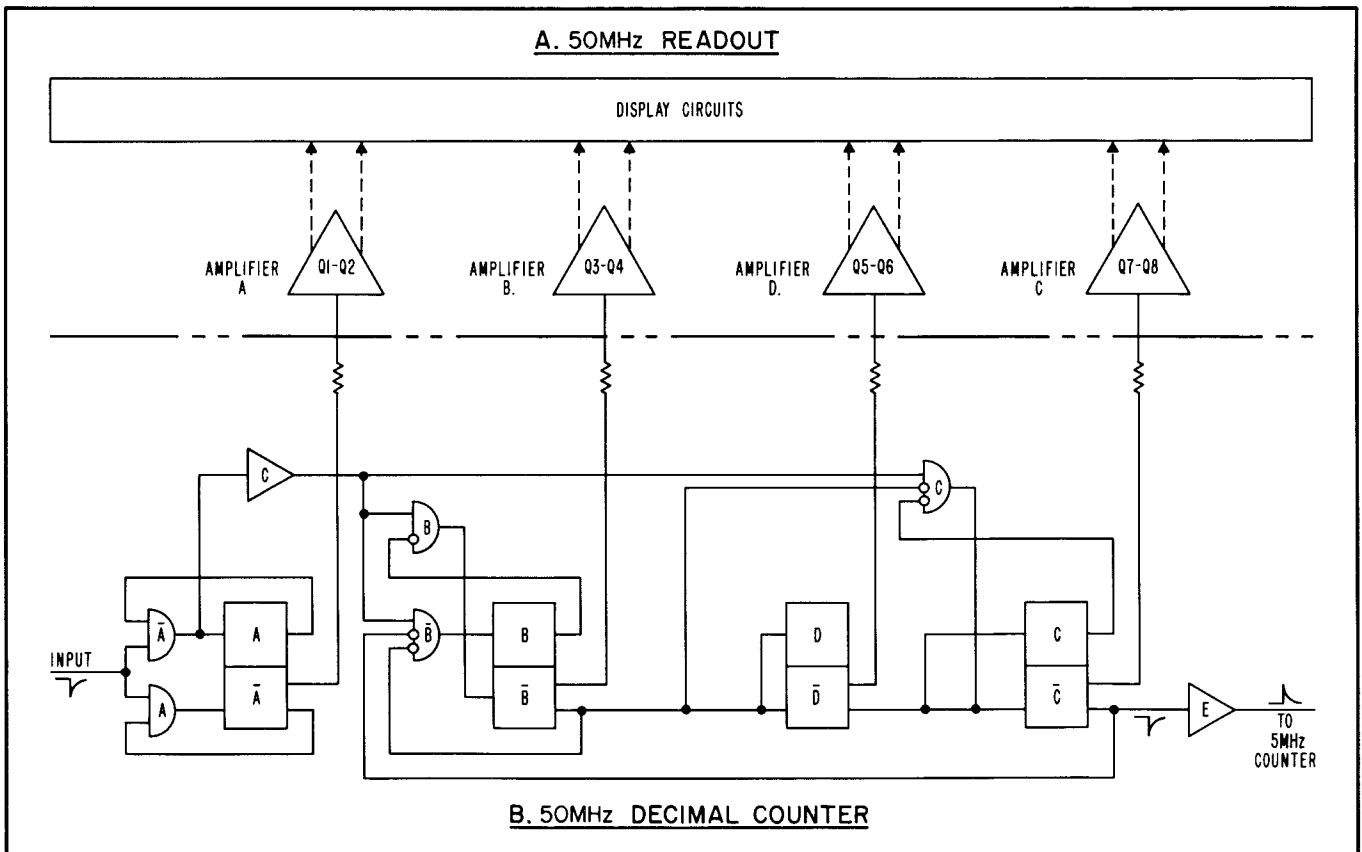

Figure 2-16. 50 MHz Readout and 50 MHz Counter Block Diagram

cable leading to the trigger on the function control assembly A21. The loaded twisted cable optimizes voltage gain, minimizes capacity effects, and isolates signal ground current. See Figure 7-17 for circuit details.

2-91. FUNCTION CONTROL ASSEMBLY A21.

2-92. GENERAL. The function control assembly, Figure 2-17, switches the counter logic circuits to perform the various counting functions. The signal which is counted by the decimal counting assemblies is switched to the high frequency trigger by one of the input gates; 1, 2, 4, or 6. The resulting pulses are gated by the main gate and then drive the 50 MHz DCA, A17. The signal to control the main gate is switched to the period trigger by input gates 3 or 5. The resulting pulses either drive the gate control assembly, A22 directly through gate 12 or are divided by the decade divider assemblies and then drive the gate control through gate 13.

2-93. SIGNAL FLOW. The following outline gives signal flow for each measurement function. In each case the control signal to the main gate is on during counting.

a. MANUAL. The input signal from A19 passes through gate 2, amplifier Q1, high frequency trigger Q3-Q4, pulse amplifier Q9, main gate Q10-Q11, and pulse amplifier Q13 to the gated signal output.

b. MANUAL CHECK. Same as MANUAL except gate 2 is off and gate 1 is on so that the selected fre-

quency from decade dividers passes through to gated signal output.

c. FREQUENCY. Input signal path same as for MANUAL. Selected frequency passes through gate 3, emitter follower Q2, period trigger Q5-Q6, and gate 12 to the gate triggering output.

d. FREQUENCY CHECK. Same as for FREQUENCY except gate 2 is off and gate 6 is on so that a 10 MHz signal passes to gated signal output.

e. PERIOD. Selected frequency from the time base control assembly A35 passes through gate 1, Q1, trigger Q3-Q4, Q9, main gate Q10-Q11, and Q13 to the gated signal output. The input signal from Q19 passes through gate 5, Q9, period trigger Q10-Q11, and gate 12 to the gate triggering outputs.

f. PERIOD CHECK. Same as PERIOD except that gate 5 is off and gate 3 is on so that the selected frequency (always 100 kHz for PERIOD CHECK) from the time base control assembly A35 passes to the gate triggering output.

g. MULTI-PERIOD. Same as PERIOD except that gate 12 is off and gate 13 is on. The output of the period trigger Q5-Q6 is divided by the chain of decade dividers. The output of the proper divider drives the multi-period trigger Q7-Q8, and passes through gate 13 to the gate triggering output.

h. MULTI-PERIOD CHECK. Same as MULTI-PERIOD except that gate 5 is off and gate 3 is on so

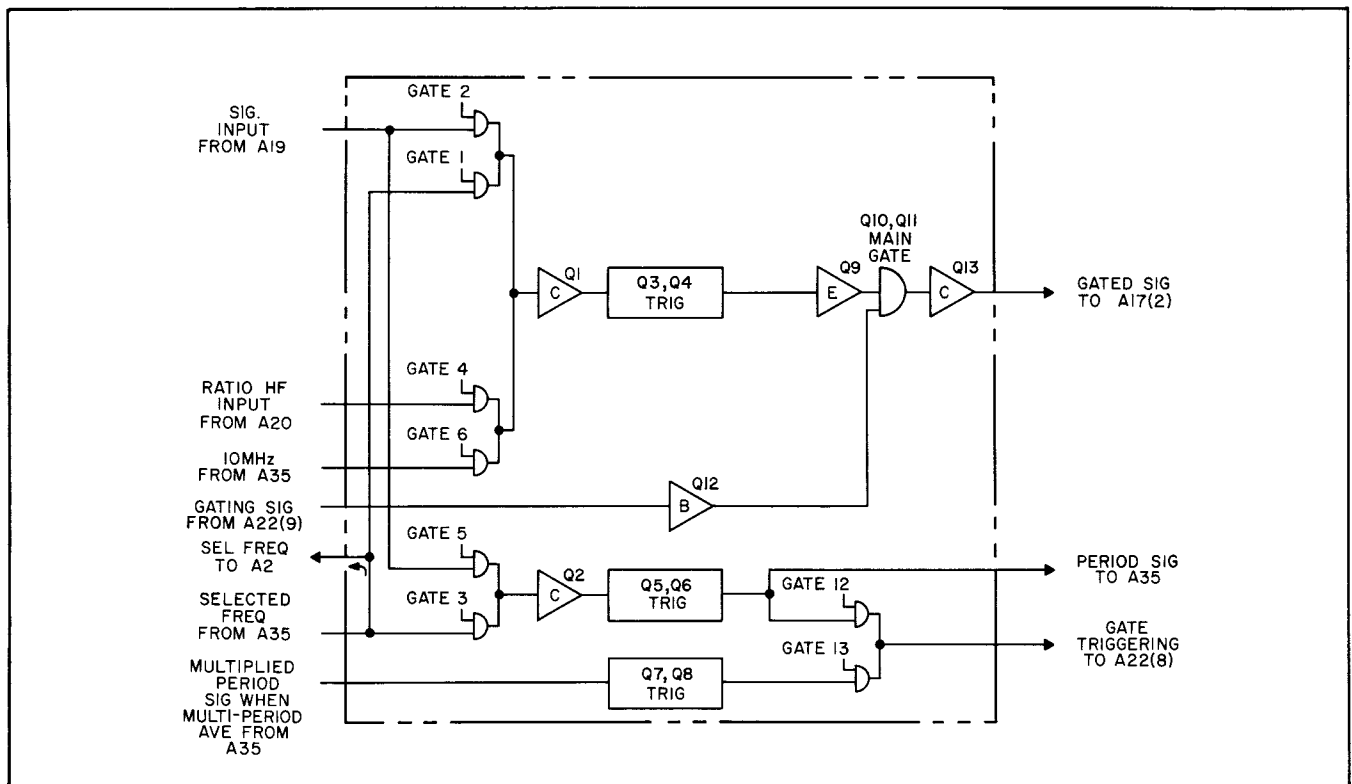

Figure 2-17. Function Control Block Diagram

that the selected frequency (always 100 kHz) from the time base control assembly A35 becomes the driving signal for the second group of decade dividers.

2-94. CIRCUIT DETAILS. Refer to the schematic diagram, Figure 7-18, for circuit details. The basic AND gate description given in Paragraph 2-6 applies to the gate circuits, but note that gates 1 through 6 consist of two diodes. The gates are turned on (signal passes) when -15 volts is applied to the control input to forward-bias the diodes; the gates are turned off (signal blocked) when the -15 volts is removed so that the fixed bias supply (from +13 volts) reverse-biases the diodes. The main gate, Q10-Q11, is open when the gating signal amplifier A12 is off, allowing the pulses from amplifier Q9 to switch the current flowing through Q10 to Q11 and to the output pulse amplifier Q13. The main gate is closed when Q12 is conducting which turns off transistors Q10 and Q11. Thus the pulses from Q9 are not allowed to drive the output pulse amplifier Q13.

2-95. GATE CONTROL ASSEMBLY A22.

2-96. GENERAL. The main function of the gate control assembly is to generate the gating signal (which controls the main gate in A21) and the sampling trigger (which starts the sample-rate multivibrator in A23). Refer to the block diagram, Figure 2-18, during the following discussion.

2-97. SIGNAL FLOW. The gate flip-flop (Q4-Q5) is normally held in its off state (in this state, it holds the main gate closed, preventing counting) by the hold-off signal from A23 which is applied through Q6. The first gate triggering pulse which occurs after the end of the holdoff pulse is amplified by Q1 and steering amplifier Q2 and operates the gate flip-flop to its on state. The next gate triggering pulse turns the gate flip-flop off through Q1 and Q3. (In MANUAL operation -15 volts is applied as a start or stop signal thru CR1 or CR2 to turn the gate flip-flop on or off.) The gate flip-flop output (positive pulse) is amplified without inversion by split-load amplifier Q7 and passed on to A21 as the gating pulse. The trailing edge of the inverted output from Q7 triggers the transfer one-shot multivibrator (Q8-Q9) which produces a 30-millisecond output pulse; the negative pulse output is supplied directly from the multivibrator as the print command pulse (negative transition tells digital recorder to accept BCD information from counter); the positive pulse output from the multivibrator is a) immediately fed back to the gate flip-flop as a hold-off signal thru Q6 to prevent retriggering of the gate flip-flop until the regular holdoff signal from A23 is generated about a microsecond later, b) delivered to A23 for amplification as the transfer pulse, and c) amplified and inverted by Q10. The Q10 output is delivered to A23 as the sampling trigger pulse. (In MANUAL operation the sampling trigger output is shorted to ground by the FUNCTION switch). The negative pulse outputs

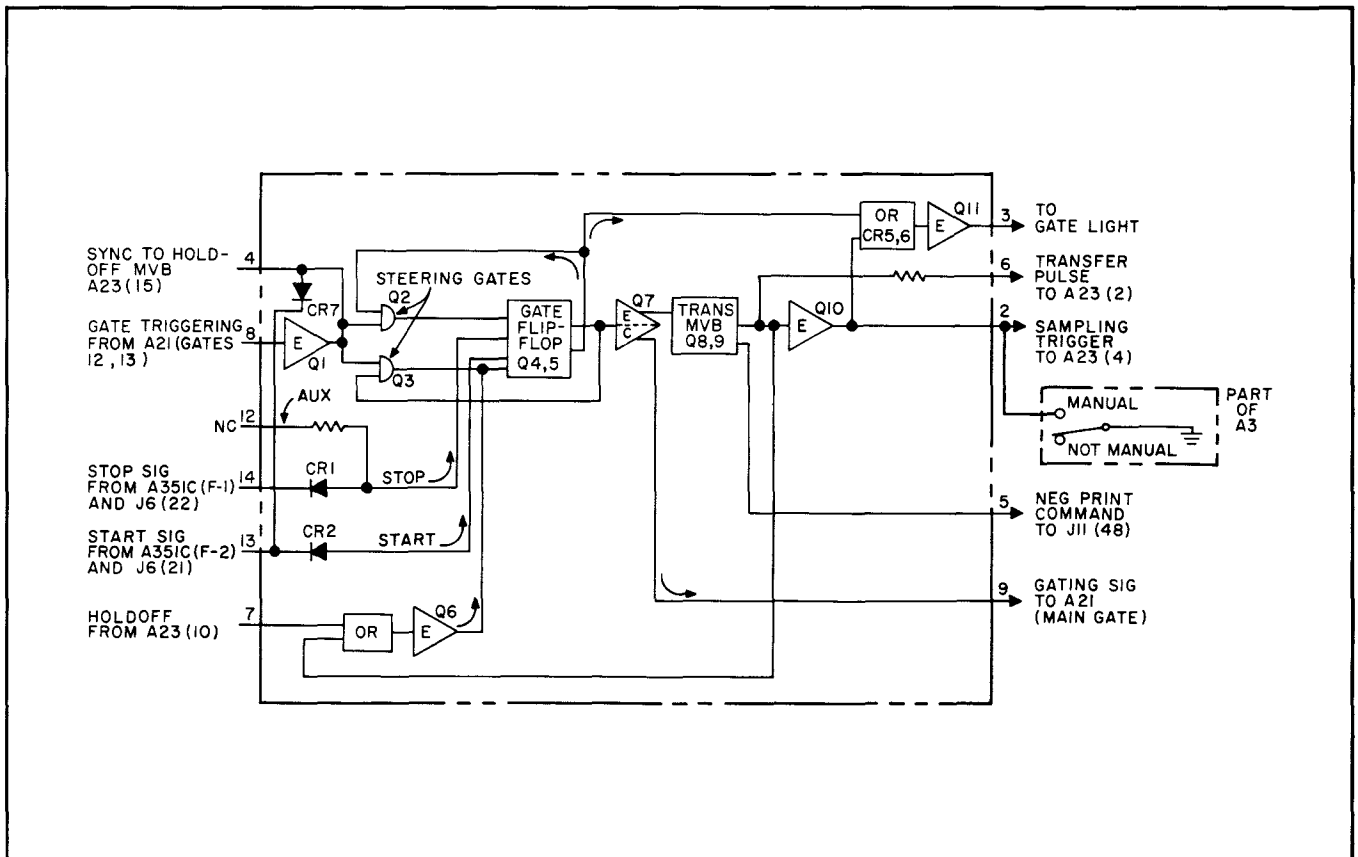

Figure 2-18. Gate Control Block Diagram

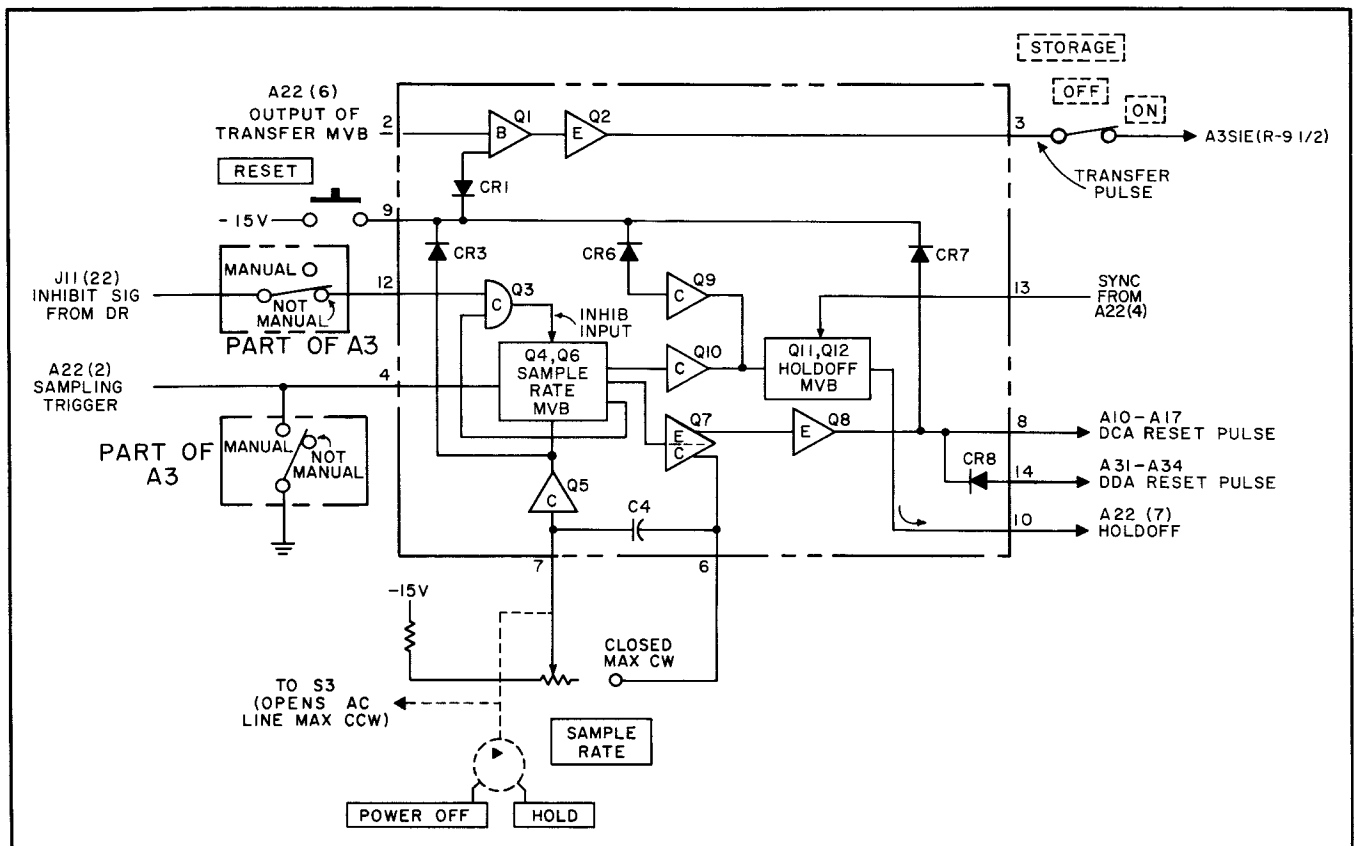

Figure 2-19. Sampling Control Block Diagram

of both the gate flip-flop and amplifier Q10 are combined, then amplified by A11 to drive the front-panel GATE lamp; the GATE lamp is therefore on during the gating signal plus 30 milliseconds; this ensures a visible flash from the lamp even for very short gates.

2-98. CIRCUIT DETAILS. Refer to the schematic diagram, Figure 7-19, for circuit details. All circuits are conventional; flip-flop operation is described in Paragraphs 2-15 and 2-16, and one-shot multivibrator operation is described in Paragraphs 2-19 thru 2-22. The steering amplifiers (Q2 and Q3) are common-base amplifiers; one amplifier (whose collector is connected to the collector of the conducting flip-flop transistor) cannot operate because of low collector voltage; the other amplifier (whose collector is connected to the collector of the cut-off flip-flop transistor) amplifies the gate triggering pulse and supplies it to the receptive flip-flop transistor.

2-99. SAMPLING CONTROL ASSEMBLY A23.

2-100. GENERAL. During normal operation, the sampling control assembly receives the positive transfer pulse and the sampling trigger pulse from A22; its outputs are a) the amplified and inverted transfer pulse, b) reset pulses for the decimal counters and decade dividers, and c) the holdoff signal which prevents retriggering of the gate flip-flop in A22. Refer to the block diagram, Figure 2-19, during the following explanation.

2-101. TRANSFER PULSE. The positive transfer pulse is amplified without inversion by Q1, then amplified and inverted by Q2. During manual reset (RESET pushbutton pressed or FUNCTION or TIME-BASE switches operated) -15 volts is amplified and inverted by Q1, then amplified and inverted by Q2 to produce a manually generated equivalent of the transfer pulse. Action of other circuits resets all decimal counters to zero before the reset contacts open; then the voltage on the transfer pulse line transfers the zero count to the front-panel numerical display.

2-102. RESET. The negative transition of the sampling trigger pulse from A22 normally triggers the sample-rate one-shot multivibrator and starts operation of all sample-rate control circuits. Multivibrator feedback is through quick-recovery amplifier Q7, capacitor C4, and emitter follower Q5. The sample-rate output pulse duration is controlled by the SAMPLE RATE potentiometer and is variable between 55 milliseconds and 5 seconds. When the SAMPLE-RATE control is operated to the HOLD position (completely clockwise), the multivibrator provides a continuous output. An amplified output is taken from Q7, differentiated (leading edge is selected), amplified by Q8, and supplied as the DCA reset pulse and the DDA reset pulse. If manual reset occurs during the sample-rate multivibrator cycle, the multivibrator is quickly returned to its quiescent state as a result of the -15 volt input through CR3.

2-103. **HOLDOFF.** A second output from the sample-rate multivibrator is amplified by Q10 to drive the holdoff one-shot multivibrator (Q11-Q12). The holdoff multivibrator output consists of a positive pulse which normally begins about 1 microsecond after the end of the gating signal and ends 55 milliseconds after the end of the sample-rate pulse. A holdoff pulse is also generated as a result of manual reset (-15 volts from manual reset line through CR6 and Q9 to Q11-Q12) so that counting cannot start until after reset switching transients have ended.

2-104. **CIRCUIT DETAILS.** Refer to the schematic diagram, Figure 7-20, for circuit details. Inhibit amplifier Q3 is in series with the Q4 collector; inhibition of the sample-rate multivibrator occurs when Q3 is cut off by a positive inhibit signal (which effectively disconnects the Q4 collector). At the end of the multivibrator cycle, recovery amplifier Q7 conducts heavily to discharge C4 rapidly in preparation for the next cycle. Refer to Paragraphs 2-19 thru 2-22 for a basic one-shot multivibrator discussion.

2-105. OSCILLATOR AND OVEN A24, A25, A26.

2-106. **GENERAL.** Crystal oven assembly A24, oven control assembly A25, and the first portion of oscillator assembly A26 provide an extremely stable 1 MHz signal. The second portion of A26 amplifies and shapes either the internally generated 1 MHz, an externally supplied 1 MHz, or, for scaler operation, the output of the decimal counter A17 or A16. Refer to the schematic diagram, Figure 7-21, during the following explanation.

2-107. **CRYSTAL OVEN ASSEMBLY A24.** The crystal oven assembly is a thermally insulated chamber which contains a heating element, a temperature sensing circuit, and a 1 MHz piezo-electric crystal.

2-108. **OVEN CONTROL ASSEMBLY A25.** The oven control assembly includes oscillator A25Q1 which produces a 3 kHz output whose amplitude is controlled by the temperature-sensing element in the oven. The oscillator output is amplified by A25Q2, detected to produce a DC level whose amplitude is inversely proportional to oven temperature. The DC level is amplified and applied to the heating element in the oven. The oven control assembly contains its own power supply which operates continuously whenever power is connected to the counter.

2-109. **OSCILLATOR ASSEMBLY A26.** The oscillator assembly includes the Q1 oscillator circuit which is connected to the 1 MHz crystal in A24. The 1 MHz oscillator output is amplified by A26Q2, A26Q3, and A26Q4. A portion of the A26Q4 output is detected and applied to A26Q1 as AGC so that power dissipation in the crystal can be held at a constant low value. Another portion of the A26Q4 output is supplied to the rear panel MODE switch where it usually is switched through to amplifier A26Q5 and trigger A26Q6-A26Q7. Outputs of 1 MHz are taken from both A26Q5 and A26Q6-A26Q7.

2-110. **CIRCUIT DETAILS.** Refer to the schematic diagram, Figure 7-21, for circuit details. The oscillator A25Q1 is controlled by the Wien bridge in A24. Positive feedback from the A25Q2 emitter through A24R1-A24C6 to the A25Q1 emitter maintains oscillation at the frequency of maximum feedback, which occurs at that frequency for which the A24R1-A24C6 phase shift equals the A24R2-A23C7 phase shift (about 3 kHz). Degenerative feedback is provided from the A25Q2 emitter and the A24RT1-A24R3-A24R4 divider to the A25Q1 base; an increase in oven temperature lowers the resistance of RT1, thus increasing degenerative feedback and lowering oscillator output; likewise, a temperature decrease results in increased degenerative feedback to produce increased oscillator output. The detector is a voltage doubler circuit; A25C2 charges fully through the negative half cycle, and then discharges through A25CR2 in series with the driving source during the positive half cycle. Capacitor A25C4 between the collector and base of A25Q4 dampens sudden DC voltage swings and filters any AC component from the detected signal. The A26Q1 oscillator is a modified Pierce oscillator; its base is maintained at a DC level from the A26R1-A26R2 junction; AGC current is supplied to its emitter from the A26CR1-A26CR2 detector (voltage doubler) which is referenced to the A26R1-A26R2 junction. Limiter A26CR5 holds signal extremities to within about 0.6 volt of ground potential (see Paragraph 2-8). Operation of the trigger circuit (A26Q6-A26Q7) is discussed in detail in Paragraphs 2-18.

2-111. MULTIPLIER ASSEMBLY A27.

2-112. The 1 to 10 MHz multiplier assembly consists of X2 multiplier Q1, X5 multiplier Q2 and amplifier Q3. Circuit details are shown in the schematic diagram, Figure 7-22. Divider R4-R5 and emitter resistor R6 provide optimum DC bias to Q1 for efficient frequency doubling; likewise, divider R8-R9 and emitter resistor R10 provide optimum DC bias to Q2 for efficient fifth-harmonic generation. The inter-stage coupling transformers (L1-L2, L3-L4, and L5-L6) include capacitive dividers in their secondary circuits (C8-C9, C13-C14, and C19-C20) for inter-stage impedance matching.

2-113. 5-MHz DECADE DIVIDER ASSEMBLY A28.

2-114. The 5 MHz decade divider assembly reduces the frequency of its input by a factor of ten (normally 1 MHz to 100 kHz). Basic operation is identical to that described for the 5 MHz decimal counter (Paragraphs 2-76 through 2-79), except that there is no displayed count. Refer to the schematic diagram, Figure 7-23, for circuit details.

2-115. LOW-FREQUENCY DECADE DIVIDER ASSEMBLY A29-A34.

2-116. A block diagram of a typical decade divider is shown in Figure 2-14B. A decade divider is an arrangement of four cascaded binaries (flip-flop) so that for every ten input pulses there is one output

pulse. Consequently, when a frequency is applied to the input of the decade divider, the first binary divides it by two (since the first pulse switches the binary to the opposite state and a second pulse is required to return it to its original state) and again by two in the second binary (making a total division by four) and so on, with an expected total division of sixteen at the output of the fourth binary. The desired division by ten is obtained by a feed-ahead pulse to the fourth binary and feedback pulses to the second and third binaries. Therefore, after the eighth input pulse is received the binaries will be in a state as if they had counted fourteen pulses. Then, when the ninth and tenth pulses are received the desired final output pulse is produced. Operation is similar to that described for the decimal counters discussed in Paragraphs 2-76 and 2-77 except that there is no display array connected to the binaries. Note that A31 through A34 are supplied with a reset input so that only a certain number of input pulses to the decade dividers are necessary after reset before an output is produced. Refer to the schematic diagram Figure 7-24, for circuit details.

2-117. TIME-BASE CONTROL ASSEMBLY A35.

2-118. GENERAL. The purpose of the time-base control is to a) lower the output impedance of the 10 MHz signal from multiplier A27; b) select a frequency between 0.1 Hz and 10 MHz as controlled by the TIME BASE switch, and c) provide a multiplied period signal when the FUNCTION switch selection is between 10 and 100K PERIOD AVERAGE. Inhibit gates 7 thru 11 (CR8, CR11, CR14, CR17, and CR20) are normally open; a control voltage to turn one of these gates off is applied only for multiplied period measurement. Multi-period gates 7 thru 11 (CR9, CR12, CR15, CR18, and CR21) are normally closed; one only is opened for multiplied period measurements. Selected frequency gates 21 thru 28 are controlled by the TIME-BASE switch.

2-119. SELECTED FREQUENCY CONTROL. For all operating functions except PERIOD AVERAGE CHECK, gates 21 thru 29 are on for the TIME BASE selections listed in Table 2-4. For example, if the TIME BASE switch is set to 1 ms, the control voltage is applied to gate 25, turning it on and permitting the 1 kHz signal from A30 to be amplified by Q11 and Q12; the amplified 1 kHz is supplied as the selected frequency to A21.

Table 2-4. Normal Time Base Control

Gate Control On	Time Base Switch
21	10 s
22	1 s
23	0.1 s
24	10 ms
25	1 ms
26	0.1 ms
27	10 μs
28	1 μs
29	0.1 μs

(For PERIOD AVERAGE CHECK, gate 27 is on, regardless of TIME BASE selection, and 100 kHz is supplied as the selected frequency.)

2-120. MULTIPLIED PERIOD CONTROL. Control voltages for gates 7 through 11 are supplied only for multiplied period measurements, as listed in Table 2-5. These control voltages select one to give steps of decade division for the period signal supplied by A21. Example 1: The FUNCTION switch is set to 10-PERIOD AVERAGE; gate control 11 is on, turning off inhibit gate 11 (to prevent further division of the signal from A26) and turning on multi-period gate 11; the amplified period signal from Q1 is passed thru CR21, divided by ten in A34, and supplied thru Q10 as the multiplied period signal. Example 2: The FUNCTION switch is set to 1K-PERIOD AVERAGE; gate control 9 is on, turning off inhibit gate 9 and turning on multi-period gate 9; the amplified period signal from Q1 is passed through CR15, divided by ten in A32, passed by CR17, divided in A33, passed by CR20, divided in A34, and supplied through Q10 as the multiplied period signal.

Table 2-5. Multiplied Period Control

Gate Control On	Function Switch
7	100K PERIOD AVE
8	10K PERIOD AVE
9	1K PERIOD AVE
10	100 PERIOD AVE
11	10 PERIOD AVE

2-121. GATING CONFLICT. A few combinations of TIME BASE and FUNCTION switch selections produce overlapping decade-divider requirements. For example, a TIME BASE selection of 0.1 s and a FUNCTION selection of 10K-PERIOD AVERAGE turns on gate control 23 and gate control 8; the expected selected frequency of 10 Hz is not supplied through CR16-Q7 since the frequency-dividing chain is blocked at CR11; the counter display is therefore meaningless. An alarm for unallowed switch combinations of this sort is given by the lighting of an asterisk (*) at the right end of the front panel display. The asterisk is also used to indicate two other non-useful control combinations: 1) TIME BASE of 0.1 μs and frequency FUNCTION, and 2) TIME BASE of 10 SEC and PERIOD function. The asterisk lamp (in A9) is controlled by switching contacts on both the TIME BASE and FUNCTION switches.

2-122. CIRCUITS. Refer to the schematic diagram, Figure 7-25, for circuit details. Most of the gates in A35 are of the type described in Paragraph 2-6, but gates 28 and 29 are two-diode AND gates, described in Paragraph 2-94. The inhibit gates (CR8, CR11, CR14, CR17, and CR20) are similar to conventional AND gates except that they are always on (forward-biased diode) in the absence of the control voltage and off (reverse-biased diode) when the control voltage is applied.

SECTION III

PERFORMANCE CHECK

3-1. GENERAL. The In-Cabinet Performance Checks, Table 3-2, and Performance Check Test Card (to be filled out during incoming inspection), pages 3-11a thru 3-11d, verify specifications and provide permanent record of the performance of each instrument. The In-Cabinet Performance Check, Table 3-2, and the Self-Check Procedure, Figure 6-1, verify proper operation of all circuits in the Model 5245L Electronic Counter and may be used:

- a. as part of an incoming inspection check of instrument specifications;
- b. periodically, for instruments used in systems where maximum reliability is of utmost importance;

c. as part of a troubleshooting procedure to locate malfunctioning circuits, and

d. after any repairs or adjustments, before returning instrument to regular service.

3-2. VARIABLE LINE VOLTAGE. During the Performance Check, Table 3-2, the Model 5245L should be connected to power source through a variable voltage device so that line voltage may be varied $\pm 10\%$ from nominal (115 or 230 Vac) to assure proper operation of the Counter under various supply conditions.

Table 3-1. Recommended Test Equipment

Instrument Type	Required Characteristics	Use	Instrument Recommended
Oscilloscope	50 MHz bandwidth, dual trace plug-in, ext sync capability.	Observe waveforms during troubleshooting and adjustment. Performance Check.	HP Model 175A Oscilloscope HP Model 1750B Dual Trace Vertical Amplifier HP AC-21C Voltage Divider Probe (two) HP 10003A 10:1 Probe
Test Oscillator	Continuously variable from 10 Hz to 50 MHz, 100 mV output.	Performance Check	HP Model 204B Oscillator HP Model 606A Test Oscillator
Low Frequency Generator	Continuously variable from 2 Hz to 10 Hz, 100 mV output.	Performance Check	HP Model 202A Low Frequency Function Generator
Pulse Generator	1 μ sec wide, 1 V negative, 1 kHz repetition rate.	Performance Check	HP Model 212A Pulse Generator
Primary Standard Oscillator	100 kHz or 1 MHz sine wave, accuracy of $< \pm 5 \times 10^{-10}$ per 24 hours.	Check accuracy of Counter time base Performance Check	HP Model 107BR
Variable line voltage source with meter	Variable from 103 to 127 Vac (207 to 253 Vac).	Performance Check	
DC Voltmeter	0V to ± 170 V, 10 megohm input impedance, 1% accuracy.	Troubleshooting and adjustments	HP Model 412A
Power Amplifier	DC to 10 MHz, 10 dB gain.	Performance Check	Dymec DY-2460A/ DY-2460A-M2
Power Supply	0V to ± 20 V	Performance Check	HP Model 721A

Table 3-1. Recommended Test Equipment (cont'd)

Instrument Type	Required Characteristics	Use	Instrument Recommended
Counter	10 MHz, 100 mV sensitivity, ± 1 count \pm time base.	Performance Check	HP Model 5245L
Mixer	10 MHz, 50 Ω impedance, 40 mW sensitivity max.	Performance Check	HP Model 10514A
Impedance Transformer	1000 ohms to 50 ohms	Performance Check	
Digital to Analog Converter	1-2-2-4 BCD code	Performance Check	HP Model 581A
Strip-Chart Recorder		Performance Check	Moseley 680
Low-Pass Filter	1 kHz	Performance Check	
Frequency Synthesizer	Precision signal source 0 to 50 MHz	Performance Check	HP Model 5100A/5110A
Coax Attenuator	Variable from 0 to 120 dB in 10 dB steps	Performance Check	HP Model 355D
Coax Attenuator	Variable from 0 to 12 dB in 1 dB steps	Performance Check	HP Model 355C
<p>Note: The Variable Coax Attenuators are used to adjust the output signal level of the Frequency Synthesizer and should be used with the Frequency Synthesizer for all checks.</p>			

Table 3-2. In-Cabinet Performance Check

FREQUENCY MEASUREMENTS
<p>1. RANGE: DC coupled: 0 to 50 MHz AC coupled: 25 Hz to 50 MHz</p>
<p>DC INPUT</p> <p>a. Set Counter controls as follows: SENSITIVITY to .1 VOLT SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE to .1 s FUNCTION to FREQUENCY - LEVEL + to PRESET</p> <p>b. Connect output of Frequency Synthesizer to Counter DC SIGNAL INPUT and to Oscilloscope input with BNC "T" connector. The oscilloscope is used to monitor the input signal.</p> <p>c. Vary frequency of Frequency Synthesizer from 0 to 50 MHz at 0.1V rms (0.28 V peak-to-peak).</p> <p>d. To check for pulse operation, connect Pulse Generator to DC INPUT connector of Counter with normal recommended load. Set Pulse Generator for 1 μsec, 1 volt pulse of the polarity used to adjust the trigger bias with a 500 pps repetition rate. Vary -LEVEL+ control until count is obtained.</p>

Table 3-2. In-Cabinet Performance Check (cont'd)

<p>AC INPUT Repeat the procedure given for DC INPUT in steps a through e with the input signal connected to the AC Input. Frequency range 50 MHz to: 1) 25 Hz lower range on 0.1 attenuator setting, 2) 5 Hz lower range on 1 attenuator setting, with 1 volt input, and 3) 0.5 Hz lower range on 10 attenuator setting, with 10V input.</p>
<p>2. GATE TIME: selectable from 1 microsecond to 10 seconds.</p>
<p>a. Set Counter controls as follows: SENSITIVITY to .1 VOLT SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE to 1 μs FUNCTION to FREQUENCY - LEVEL+ to PRESET</p> <p>b. Connect Frequency Synthesizer output to Counter DC SIGNAL INPUT.</p> <p>c. Set Frequency Synthesizer for 10 MHz at 0.1 V rms.</p> <p>d. Rotate TIME BASE switch counterclockwise through 10s gate position and observe counter reading for each setting. Record results on test card.</p>
<p>3. ACCURACY: - 1 count, \pm time base accuracy.</p>
<p>a. Set Counter controls as follows: SENSITIVITY to .1 VOLT SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE to 1 μs FUNCTION to FREQUENCY - LEVEL + to PRESET</p> <p>b. Allow Counter to warm up for 72 hours. Internal crystal should be stabilized and calibrated to 1×10^8 to a primary standard.</p> <p>c. Connect output of Frequency Synthesizer (calibrated to 1×10^8 to a primary standard) to the Counter DC INPUT.</p> <p>d. Set Frequency Synthesizer to 50 MHz at 0.1V rms.</p> <p>e. With TIME BASE switch in the 1 μs position, the Counter should count 50 MHz \pm 1 count. Record accuracy on test card.</p> <p>f. Change the TIME BASE switch to the 10s gate position. The Counter should count 50 MHz \pm 12 counts. Record accuracy on test card.</p>
<p>4. OUTPUT DISPLAY: 8 significant figures with decimal point units of measure (kHz or MHz).</p>
<p>SELF-CHECK: counts 10 MHz for the gate time chosen by the TIME BASE switch.</p>
<p>a. Use Self-Check procedure; see Figure 6-1, page 6-4.</p> <p>b. Record results on test card.</p>
SCALING
<p>1. RANGE: 0 to 50 MHz</p>
<p>a. Set Counter controls as follows: SENSITIVITY to .1V SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE to 10s FUNCTION to MANUAL START - LEVEL + to PRESET MODE (rear panel) to SCALER OUTPUT (rear panel) to SCALER RATIO 10</p>

Table 3-2. In-Cabinet Performance Check (cont'd)

<p>b. Connect output from rear panel SCALER RATIO OUTPUT jack to Oscilloscope or another 5245L.</p> <p>c. Connect output of Frequency Synthesizer to Counter DC SIGNAL INPUT.</p> <p>d. Set Frequency Synthesizer for 50 MHz at 0.1 V rms. The scaled output should be 5 MHz. Record results on test card.</p>
<p>2. FACTOR: by decade selectable from 10 to 10⁹.</p>
<p>a. Set Counter controls as follows</p> <p style="padding-left: 40px;">SENSITIVITY to .1 VOLT SAMPLE RATE to slightly clockwise out of POWER OFF. TIME BASE to 10 sec. FUNCTION to MAN START. - LEVEL + to PRESET MODE (rear panel) to SCALER OUTPUT (rear panel) to SCALER RATIO 10.</p> <p>b. Connect rear panel SCALER RATIO OUTPUT to the Oscilloscope or another Counter.</p> <p>c. Connect the output of the Frequency Synthesizer to the Counter DC SIGNAL INPUT.</p> <p>d. Set Frequency Synthesizer output for 50 Mhz at 0.1V rms.</p> <p>e. Rotate rear panel OUTPUT switch through SCALER RATIO positions from 10 through 10⁹. The OUTPUT should reduce by a factor of 10 for each setting. Record results on test card.</p>
PERIOD MEASUREMENTS
<p>1. FREQUENCY RANGE SINGLE PERIOD: 0 to 1 MHz</p>
<p>a. Set Counter controls as follows:</p> <p style="padding-left: 40px;">SENSITIVITY to .1 VOLT SAMPLE RATE to slightly clockwise out of POWER OFF TIME BASE to .1 μsec FUNCTION to 1 PERIOD AVERAGE - LEVEL + to PRESET</p> <p>b. Connect output of Frequency Synthesizer to Counter DC SIGNAL INPUT.</p> <p>c. Set Synthesizer Frequency for 1 Mhz at 0.1V rms.</p> <p>d. Counter should display 1 μs, with decimal point correctly positioned and measurement unit displayed. Record results on test card.</p>
<p>2. FREQUENCY RANGE MULTIPLE PERIOD: 0 to 300 kHz.</p>
<p>a. Set Counter controls as follows:</p> <p style="padding-left: 40px;">SENSITIVITY to .1 VOLT SAMPLE RATE to slightly clockwise out of POWER OFF TIME BASE to 10 sec. FUNCTION to PERIOD AVERAGE - LEVEL + to PRESET</p> <p>b. Connect output of Frequency Synthesizer to Counter DC SIGNAL INPUT.</p> <p>c. Set Frequency Synthesizer for 300 kHz at 0.1V rms.</p> <p>d. Rotate TIME BASE switch clockwise to .1 μs observing count. Switch FUNCTION switch to 10 PERIOD AVERAGE and rotate TIME BASE switch counterclockwise through 10 sec observing count at each setting. Repeat rotation of TIME BASE switch at each position of PERIOD AVERAGE switch. Record results on test card.</p> <p>This check also checks Item 5, OUTPUT DISPLAY.</p>

Table 3-2. In-Cabinet Performance Check (cont'd)

<p>3. PERIOD MEASUREMENT ACCURACY: ± 1 count \pm time base accuracy \pm trigger error where the trigger error is expressed as $\pm 0.3\%$ over 1 period divided by the number of periods averaged for signals with a signal to noise ratio of greater than 40 dB.</p>
<p>a. Set Counter controls as follows:</p> <p style="padding-left: 40px;">SENSITIVITY to .1 VOLT SAMPLE RATE to slightly clockwise out of POWER OFF TIME BASE to .1 μsec FUNCTION to 1 PERIOD AVERAGE - LEVEL + to PRESET</p> <p>b. Connect output of Frequency Synthesizer to Counter DC SIGNAL INPUT.</p> <p>c. Set Frequency Synthesizer for 1 MHz at 0.1 V rms.</p> <p>d. Counter should display 1 μs \pm 1 count. Record results on test card.</p>
<p>4. PERIODS AVERAGED: 1 to 10^5 periods in decade steps.</p>
<p>a. Set Counter controls as follows:</p> <p style="padding-left: 40px;">SENSITIVITY to .1 VOLT SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE to .1 μsec FUNCTION to 1 PERIOD AVERAGE - LEVEL + to PRESET</p> <p>b. Connect output of Frequency Synthesizer Counter DC SIGNAL INPUT.</p> <p>c. Set Frequency Synthesizer for 300 kHz at 0.1V rms.</p> <p>d. Rotate FUNCTION switch from 1 PERIOD AVERAGE through 100K (10^5) PERIOD AVERAGE and observe count in each setting. Record results on test card.</p>
<p>5. OUTPUT DISPLAY: 8 significant figures with decimal point and units of measure (sec, ms, or μs).</p>
<p>This is checked by Item 2 , FREQUENCY RANGE MULTIPLE PERIOD. If check is satisfactory, mark test card OK.</p>
<p>6. SELF CHECK: Gate time is 10 μs to 1 sec (periods averaged of 100 kHz); counts 100 kHz from the time base.</p>
<p>Use Self Check Table 6-5, page 6-5. Record results on test card.</p>
<p>FREQUENCY RATIO MEASUREMENTS</p>
<p>1. F1 FREQUENCY RANGE: 0 to 50 MHz</p>
<p>a. Set Counter controls as follows:</p> <p style="padding-left: 40px;">SENSITIVITY to .1 VOLT SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE to EXT. FUNCTION to 1 PERIOD AVERAGE - LEVEL + to PRESET</p> <p>b. Connect Frequency Synthesizer to Counter TIME BASE EXT connector and set output to 0.1V rms.</p> <p>c. Connect HP 5245L 100 Hz OUTPUT STD FREQ to Counter AC SIGNAL INPUT (F2 INPUT).</p> <p>d. Observe ratio of F/1 MHz by selecting F1 on Frequency Synthesizer as shown in table on the following page; record readings.</p>

Table 3-2. In-Cabinet Performance Check (cont'd)

<u>F1</u>	<u>F2</u>	<u>Ratio F1/F2</u>
50 MHz	100 Hz	500,000
10 MHz	100 Hz	100,000
1 MHz	100 Hz	10,000
100 kHz	100 Hz	1,000
10 kHz	100 Hz	100
1 kHz	100 Hz	10
500 Hz	100 Hz*	5
100 Hz	100 Hz	1

2. F2 FREQUENCY RANGE: 0 to 300 kHz.

a. Set Counter controls as follows:
 SENSITIVITY to .1 VOLT
 SAMPLE RATE to slightly clockwise out of POWER OFF
 TIME BASE to EXT.
 FUNCTION to 10 PERIOD AVERAGE.
 - LEVEL + to PRESET

b. Connect Frequency Synthesizer set for 1 MHz (F₁) at 0.1V rms to the Counter TIME BASE EXT connector.

c. Connect Low Frequency Generator to Counter DC SIGNAL INPUT. Vary Low Frequency Generator from 2, 5, and 10 Hz at 0.1V rms. Observe Counter display for ratio F1/F2. Record results on test card.

d. Replace Low Frequency Generator with Synthesizer and set to frequencies as shown (F2). Use 1 MHz from OUTPUT STD FREQ for F1. Record readings on test card.

F2	Ratio F1/F2
2	500000
5	200000
10	100000
100	10000
1 kHz	1000
100 kHz	10
300 kHz	3

3. MULTIPLE PERIOD: 1 to 10⁵ in decade steps.

a. Set Counter controls as follows:
 SENSITIVITY to .1 VOLT
 SAMPLE RATE to slightly clockwise out of POWER OFF
 TIME BASE to EXT
 FUNCTION to 1 PERIOD AVERAGE
 - LEVEL + to PRESET

c. Connect Frequency Synthesizer set to 1 MHz (F₁) at 0.1V rms to Counter TIME BASE EXT input.

d. Connect Oscillator set to 100 kHz at 0.1V rms to Counter DC SIGNAL INPUT.

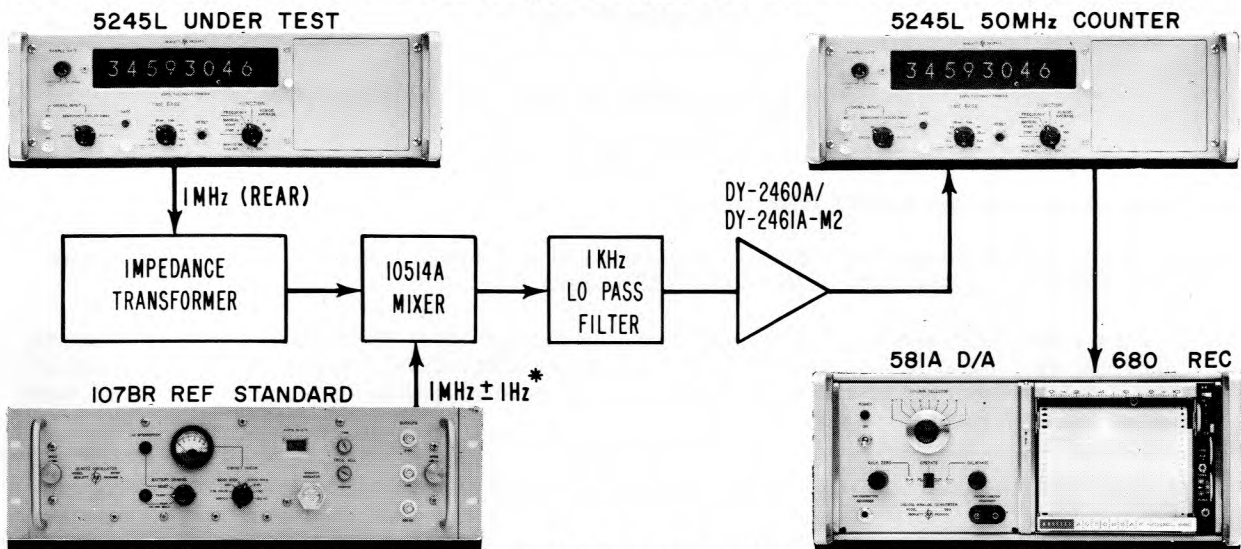

e. Counter should display the ratio of F1/F2 ± 1 count. Record results on test card.

TIME BASE: FREQUENCY (INTERNAL): 1 MHz

1. Stability: Aging Rate: Less than 3 parts in 10⁹ per 24 hours.
 As a function of line voltage: less than ± 5 parts in 10¹⁰ for changes of ± 10%.
 As a function of ambient temperature: less than ± 2 parts in 10¹⁰ per °C from -20°C to +55°C.

Table 3-2. In-Cabinet Performance Check (cont'd)

Measure the stability of the time base using the circuit shown below and the following procedure:

* COUNTER UNDER TEST MAY BE OFFSET $\pm 1\text{Hz}$ INSTEAD OF REFERENCE STANDARD

TEMPERATURE:

- Place the Counter in a temperature-controlled environment. The rest of the circuit should be in a constant temperature environment.
- Set controls of Counter under test as follows:
 SAMPLE RATE slightly clockwise out of POWER OFF
 MODE (rear panel) to INT FREQ STD
 OUTPUT (rear panel) to $1\text{ MHz } 10^2$
- Set digital to analog converter to analog columns 4, 5, and 6. This gives a full scale plot on the strip chart recorder of 10 parts in 10^9 .
- Set the Counter (Table 5-1) to $.1\ \mu\text{sec}$ TIME BASE and FUNCTION switch to 10 PERIOD AVERAGE.
- Make a reference plot with Counter at room temperature. Lower the temperature of the Counter under test to -20°C and allow 3 hours for the Counter to reach thermal equilibrium. Make a plot of the output and record any change on the test card. Increase temperature gradually to $+55^\circ\text{C}$ and allow 3 hours for thermal equilibrium. Make a plot of the output and record any change on the test card. Note that the change in frequency shall not exceed ± 2 parts in 10^{10} per $^\circ\text{C}$ change of ambient temperature. (If necessary set Converter to columns 5, 6, 7 for 10 parts in 10^8 full scale.)

LINE VOLTAGE:

- Connect the Counter under test to a variable voltage power line source. Using the same system as used for temperature check, make a plot with the line voltage at 115V rms. Lower the line voltage 10% to 103V rms and make a second plot. Set the line voltage to 10% above normal line, 127V rms, and make a third plot. Record any change in frequency on test card. Note that the frequency change is less than ± 5 parts in 10^{10} from the first reference plot.

LONG TERM STABILITY:

- The system should be in a constant temperature environment. Allow 72 hours of continuous operation to stabilize the Counter. Make a reference plot and record the temperature and line voltage on the test card. Repeat the check in 24 hours and record any change in frequency on the test card. Temperature and line voltage must be the same as the first check or compensations for any differences must be made.

Table 3-2. In-Cabinet Performance Check (cont'd)

<p>2. TIME BASE-Output-FRONT PANEL: 0.1 Hz to 1 MHz in decade steps; 1V peak-to-peak. (See specifications Table 1-1.)</p>
<p>a. Set Counter controls as follows: SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE to 1 μs FUNCTION to FREQUENCY</p> <p>b. Connect Oscilloscope to EXT input jack.</p> <p>c. Oscilloscope should display 1 MHz rectangular wave of 1V peak-to-peak. Record on test card the frequency and amplitude of the TIME BASE output.</p> <p>d. Set the TIME BASE switch to each position, 10 μs through 10s. The displayed frequency should decrease by a factor of 10 for each successive setting of the TIME BASE. The amplitude should be 1V peak-to-peak for all settings. Record on test card frequency and amplitude of TIME BASE output for each successive setting.</p>
<p>3. TIME BASE-Output-REAR PANEL: 0.1 Hz to 10 MHz in decade steps 5V peak-to-peak rectangular wave with 1000-Ω source at 1 MHz and lower; 1V rms sine wave with 1000-Ω source impedance only at 10 MHz. (See specifications Table 1-1.)</p>
<p>a. Set Counter controls as follows: SAMPLE RATE slightly clockwise out of POWER OFF MODE (rear panel) to INT STD FREQ OUTPUT (rear panel) to 10 MHz 10</p> <p>b. Connect Oscilloscope to the OUTPUT connector (J5) on the rear panel.</p> <p>c. Oscilloscope should display 10 MHz at 1V rms. Record the frequency and amplitude on test card.</p> <p>d. Set the OUTPUT switch to each position, 1 MHz 10^2 through .1 Hz 10^9. The displayed frequency should decrease by a factor of 10 for each successive setting of the OUTPUT switch.</p>
<p>INPUT ATTENUATION</p>
<p>1. Range: Three ranges 0.1, 1.0, and 10 volts.</p>
<p>a. Set Counter controls as follows: SENSITIVITY to .1 VOLT SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE to .1s FUNCTION to FREQUENCY - LEVEL + to PRESET</p> <p>b. Connect Oscillator to Counter DC SIGNAL INPUT. Set Oscillator for 100 kHz at 100 mV (.1V) rms. Counter should count and display 100 kHz.</p> <p>c. Change Counter SENSITIVITY to 1.0 volt. Increase Oscillator output to 100 kHz at 1V rms. The Counter should count and display 100 kHz. Record results on test card.</p> <p>d. Change Counter SENSITIVITY to 10 volts. Increase Oscillator output to 100 kHz at 10V rms. The Counter should count and display 100 kHz. Record results on test card.</p>
<p>DISPLAY STORAGE</p>
<p>a. Set Counter controls as follows: SENSITIVITY to CHECK SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE to .1s FUNCTION to FREQUENCY STORAGE (rear panel) to OFF - LEVEL + to PRESET</p>

Table 3-2. In-Cabinet Performance Check (cont'd)

<p>b. Counter should count 10,000.000 kHz. The change in count should be visible on each digital display tube.</p> <p>c. Set Counter STORAGE switch to the STORAGE position. The Counter should count, display, and hold 10,000,000 kHz count providing a continuous display of the most recent count. Record results on test card.</p>
SAMPLE RATE
<p>1. Sample Rate: Variable from less than .2 sec to greater than 5 seconds.</p>
<p>a. Set Counter controls as follows: SENSITIVITY to CHECK SAMPLE RATE to POWER OFF TIME BASE to 10 ms FUNCTION to FREQUENCY - LEVEL + to PRESET</p> <p>b. Connect Oscilloscope to J11 Pin 48.</p> <p>c. Turn the Counter SAMPLE RATE control slightly clockwise out of POWER OFF, and note that the Counter turns on.</p> <p>d. With the SAMPLE RATE control in maximum position (ccw), observe with oscilloscope the negative pulse duration between gate closing and the following gate opening; it should be less than 200 milliseconds (.2 sec).</p> <p>e. Increase the SAMPLE RATE control clockwise to minimum sample rate. Observe with Oscilloscope the negative pulse duration between gate closing and the following gate opening; it should be more than 5 seconds.</p> <p>f. Set the SAMPLE RATE control to the Hold position. The last Counter reading should remain displayed indefinitely. Record results on test card.</p>
DIGITAL OUTPUT
<p>1. Output 4 line 1-2-2-4 BCD: Impedance 100K each line "0" State Level -8V "1" State Level +18V</p>
<p>a. The impedance is determined by a fixed value 100K resistor, which can be seen in schematic diagrams Figures 7-9 , 7-11 , and 7-14 .</p> <p>b. Set Counter controls as follows: SAMPLE RATE slightly clockwise out of POWER OFF SENSITIVITY to .1 V TIME BASE to 1 μs FUNCTION to MANUAL START MODE (rear panel) to INT STD FREQ</p> <p>c. Connect Frequency Synthesizer to Counter AC INPUT connector. Set output level at 1 V rms.</p> <p>d. Connect Oscilloscope to following points to verify "0" state and "1" state levels. Oscilloscope will display the switch from "0" state (-8 volts) to "1" state (+18 volts) as a positive 26 volts step. Check all recorder outputs for "0" state and "1" state and mark the test card ok.</p>

2. Reference Levels: approx. +17 volts, 350-ohm source impedance; approx. -6.5V, 1000-ohm source.

- a. Set Counter SAMPLE RATE control slightly clockwise out of POWER OFF.
- b. Connect DC Voltmeter to DIGITAL RECORDER jack (J11) pin 25 to check pos reference (+17V) and pin 24 to check neg reference (-6V). Record the amplitude of both reference voltages on test card.

Table 3-2. In-Cabinet Performance Check (cont'd)

3. Print Command: Negative step from +13 volts to 0 volts, DC-coupled.
<ul style="list-style-type: none"> a. Connect Oscilloscope to DIGITAL RECORDER jack (J11) pin 48. b. Set Counter controls as follows: SAMPLE RATE slightly clockwise out of POWER OFF SENSITIVITY to CHECK TIME BASE to 10 ms FUNCTION to FREQUENCY c. The Oscilloscope should display the print command step (-13 volts for each counting cycle). Record the amplitude of this negative step on test card.
4. Hold-Off Requirements: +15V min., +25V max. from chassis ground (1000-ohm source).
<ul style="list-style-type: none"> a. Set Counter controls as follows: SAMPLE RATE slightly clockwise out of POWER OFF SENSITIVITY to CHECK TIME BASE to 10 s STORAGE (on rear panel) to non-storage FUNCTION to FREQUENCY b. With DC Power Supply, apply hold-off voltage, +25 volts in series with a 1000-ohm resistor to DIGITAL RECORDER jack (J11) Pin 22 on the rear panel. The Counter should stop until the hold-off voltage is removed from J11, pin 22. Record hold-off voltage on test card. c. Repeat step b, using +15 hold-off voltage. Record hold-off voltage on test card. Note this check can be made using any hold-off voltage from +15 volts to +25 volts.
GATE INDICATOR. Front panel indication of main gate "open" state
<ul style="list-style-type: none"> a. Set Counter controls as follows: SENSITIVITY to CHECK SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE to 10 s FUNCTION to MANUAL STOP - LEVEL + to PRESET b. Set Counter FUNCTION switch to MANUAL START, the Counter gate lamp should turn on. Record results on test card.
RE-SET CAPABILITY. A momentary control on the front panel that returns both the displayed and internal count to zero.
<ul style="list-style-type: none"> a. Set Counter controls as follows: SENSITIVITY to CHECK SAMPLE RATE slightly clockwise out of POWER OFF TIME BASE TO 10s FUNCTION to FREQUENCY - LEVEL + to PRESET b. Push front panel RESET pushbutton. Counter should reset and then start a new count. Record result on test card.

SECTION IV REPLACEABLE PARTS

4-1. INTRODUCTION.

4-2. This section contains information for ordering replacement parts. Table 4-1 lists parts in alpha-numerical order of their reference designators and indicates the description and HP stock number of each part, together with any applicable notes. Table 4-2 lists parts in alpha-numerical order of their HP stock number and provides the following information on each part;

- a. Description of the part (see list of abbreviations below).
- b. Typical manufacturer of the part in a five-digit code; see list of manufacturers in Table 4-3.
- c. Manufacturer's part number.
- d. Total quantity used in the instrument (TQ column).

4-3. Miscellaneous parts are listed at the end of Table 4-1.

4-4. ORDERING INFORMATION.

4-5. To obtain replacement parts, address order or inquiry to your local Hewlett-Packard Field Office (see lists at rear of this manual for addresses). Identify parts by their Hewlett-Packard stock numbers.

4-6. To obtain a part that is not listed, include:

- a. Instrument model number.
- b. Instrument serial number.
- c. Description of the part.
- d. Function and location of the part.

REFERENCE DESIGNATORS

A = assembly	E = misc electronic part	P = plug	V = vacuum, tube, neon bulb, photocell, etc.
B = motor	F = fuse	Q = transistor	VR = voltage regulator
BT = battery	FL = filter	R = resistor	W = cable
C = capacitor	J = jack	RT = thermistor	X = socket
CP = coupler	K = relay	S = switch	Y = crystal
CR = diode	L = inductor	T = transformer	
DL = delay line	M = meter	TB = terminal board	
DS = device signaling (lamp)	MP = mechanical part	TP = test point	

ABBREVIATIONS

A = amperes	H = henries	NPN = negative-positive-negative	RMS = root-mean square
A. F. C. = automatic frequency control	HEX = hexagonal	NRFR = not recommended for field replacement	RWV = reverse working voltage
AMPL = amplifier	HG = mercury	NSR = not separately replaceable	S-B = slow-blow
B. F. O. = beat frequency oscillator	HR = hour(s)	OBD = order by description	SCR = screw
BE CU = beryllium copper	IF = intermediate freq	OH = oval head	SE = selenium
BH = binder head	IMPG = impregnated	OX = oxide	SECT = section(s)
BP = bandpass	INCD = incandescent	PC = peak	SEMICON = semiconductor
BRS = brass	INCL = include(s)	PF = printed circuit	SI = silicon
BWO = backward wave oscillator	INS = insulation(ed)	PH BRZ = phosphor bronze	SIL = silver
CCW = counter-clockwise	INT = internal	PHL = Phillips	SL = slide
CER = ceramic	K = kilo = 1000	PIV = peak inverse voltage	SPG = spring
CMO = cabinet mount only	LH = left hand	PNP = positive-negative-positive	SPL = special
COEF = coefficient	LIN = linear taper	P/O = part of	SST = stainless steel
COM = common	LK WASH = lock washer	POLY = polystyrene	SR = split ring
COMP = composition	LOG = logarithmic taper	PORC = porcelain	STL = steel
COMPL = complete	LPF = low pass filter	POS = position(s)	TA = tantalum
CONN = connector	M = milli = 10 ⁻³	POT = potentiometer	TD = time delay
CP = cadmium plate	MEG = meg = 10 ⁶	PP = peak-to-peak	TGL = toggle
CRT = cathode-ray tube	MET FLM = metal film	PT = point	THD = thread
CW = clockwise	MET OX = metallic oxide	PWV = peak working voltage	TI = titanium
DEPC = deposited carbon	MFR = manufacturer	RECT = rectifier	TOL = tolerance
DR = drive	MINAT = miniature	RH = round head or right hand	TRIM = trimmer
ELECT = electrolytic	MOM = momentary	RMO = rack mount only	TWT = traveling wave tube
ENCAP = encapsulated	MTG = mounting		
EXT = external	MY = "mylar"		
F = farads	N = nano (10 ⁻⁹)		U = micro = 10 ⁻⁶
FH = flat head	N/C = normally closed		VAR = variable
FIL H = fillister head	NE = neon		VDCW = dc working volts
FXD = fixed	NI PL = nickel plate		W/ = with
GE = germanium	N/O = normally open		W = watts
GL = glass	NPO = negative positive zero (zero temperature coefficient)		WIV = working inverse voltage
GRD = ground(ed)			WW = wirewound
			W/O = without

Table 4-3. Manufacturer's Code List

The following code numbers are from the Federal Supply Code for Manufacturers Cataloging Handbooks H4-1 (Name to Code) and H4-2 (Code to Name) and their latest supplements. The date of revision and the date of the supplements used appear at the bottom of each page. Alphabetical codes have been arbitrarily assigned to suppliers not appearing in the H4 Handbooks.

Code No.	Manufacturer	Address	Code No.	Manufacturer	Address	Code No.	Manufacturer	Address

SECTION V OPTIONS AND MANUAL CHANGES

5-1. OPTIONS.

5-2. The 5245L has two options available. They are Option 02, 4-line BCD 1248 "1" state positive and Option 03, 4-line BCD 1248 "1" state negative. These options change the BCD output code of the digits. The decimal point and measurement units BCD output code is 1224 "1" state positive.

5-3. OPTION 02 +1248 BCD CODE.

5-4. Option 02 consists of changing the assemblies listed in Table 5-1. Circuit diagrams for the Option 02 assemblies are shown in Figures 7-10, 7-12, and 7-15.

Table 5-1. Option 02 Replacement Assemblies

Standard Assemblies	Option 02 Assemblies
A10-A15 DCA 05212-6016	A10-A14 DCA 05212-6002
A16 DCA 05232-6010	A15-A16 DCA 05232-6014
A18 Readout 5245L-4B	A18 Readout 05245-6001

5-5. OPTION 03 -1248 BCD CODE.

5-6. Option 03 consists of changing the assemblies listed in Table 5-2. Circuit diagrams for the Option 03 assemblies are shown in Figures 7-10, 7-12, and 7-16.

Table 5-2. Option 03 Replacement Assemblies

Standard Assemblies	Option 03 Assemblies
A10-A15 DCA 05212-6016	A10-A14 DCA 05212-6003
A16 DCA 05232-6010	A15-A16 DCA 05232-6012
A18 Readout 5245L-4B	A18 Readout 05245-6003

5-7. The parts lists for the Option 02 and 03 assemblies are listed in Tables 5-4, 5-5, 5-6, and 5-7.

5-8. Figures 7-10 and 7-12 are used for both Option 02 +1248 BCD output and Option 03 -1248 BCD output. The boards are identical with one exception. The DCA's with "1" state positive BCD output have resistors marked with a double asterisk (**) connected to collectors as shown by — + — + — lines. The DCA's with "1" state negative BCD output have these resistors connected to opposite collectors as shown by — - - - — lines.

Table 5-3. 1-2-4-8 Code Truth Table

Digit	4-Line Code, 1-2-4-8			
	D = 8	C = 4	B = 2	A = 1
0	0	0	0	0
1	0	0	0	1
2	0	0	1	0
3	0	0	1	1
4	0	1	0	0
5	0	1	0	1
6	0	1	1	0
7	0	1	1	1
8	1	0	0	0
9	1	0	0	1

Option 02: Output Code: 0 = -8V, 1 = +18V
Option 03: Output Code: 1 = -8V, 0 = +18V

5-9. SPECIALS.

5-10. Decimal Point and Measurement Units assemblies with either "1" state positive or negative 1248 BCD output may be obtained by special order. Specification J35-5245L is a modified 5245L that provides a 1248 "1" state positive BCD code for all eight digits, decimal point assembly, and measurement units assembly. Specification J36-5245L is a modified 5245L that provides a 1248 "1" state negative BCD code for all eight digits, decimal point assembly, and measurement units assembly.

5-11. Circuit diagrams for these specials are shown in Figures 5-1 and 5-2. Parts lists for the specials are listed in Tables 5-8 and 5-9.

5-12. Remote control operation is also available by special order. Programming information is covered in the Model 5245L Operating Manual, Paragraphs 3-14 through 3-17, page 3-11. Circuit diagram showing additional wiring is shown in Figure 5-3.

5-13. MANUAL CHANGES.

5-14. CURRENT INSTRUMENTS.

5-15. This manual applies directly to standard Model 5245L Electronic Counter having serial prefix number 716- (refer to Paragraph 1-6).

5-16. OLDER INSTRUMENTS.

5-17. This manual applies directly to the 5245L Electronic Counters having serial prefix number 716-. This manual with the changes listed in Table 5-10 also applies to 5245L Electronic Counters having serial prefix numbers 648 and 628. For information covering 5245L Electronic Counters having serial prefix numbers 544 or below, refer to 5245L Operating and Service Manual serial prefixed 544.

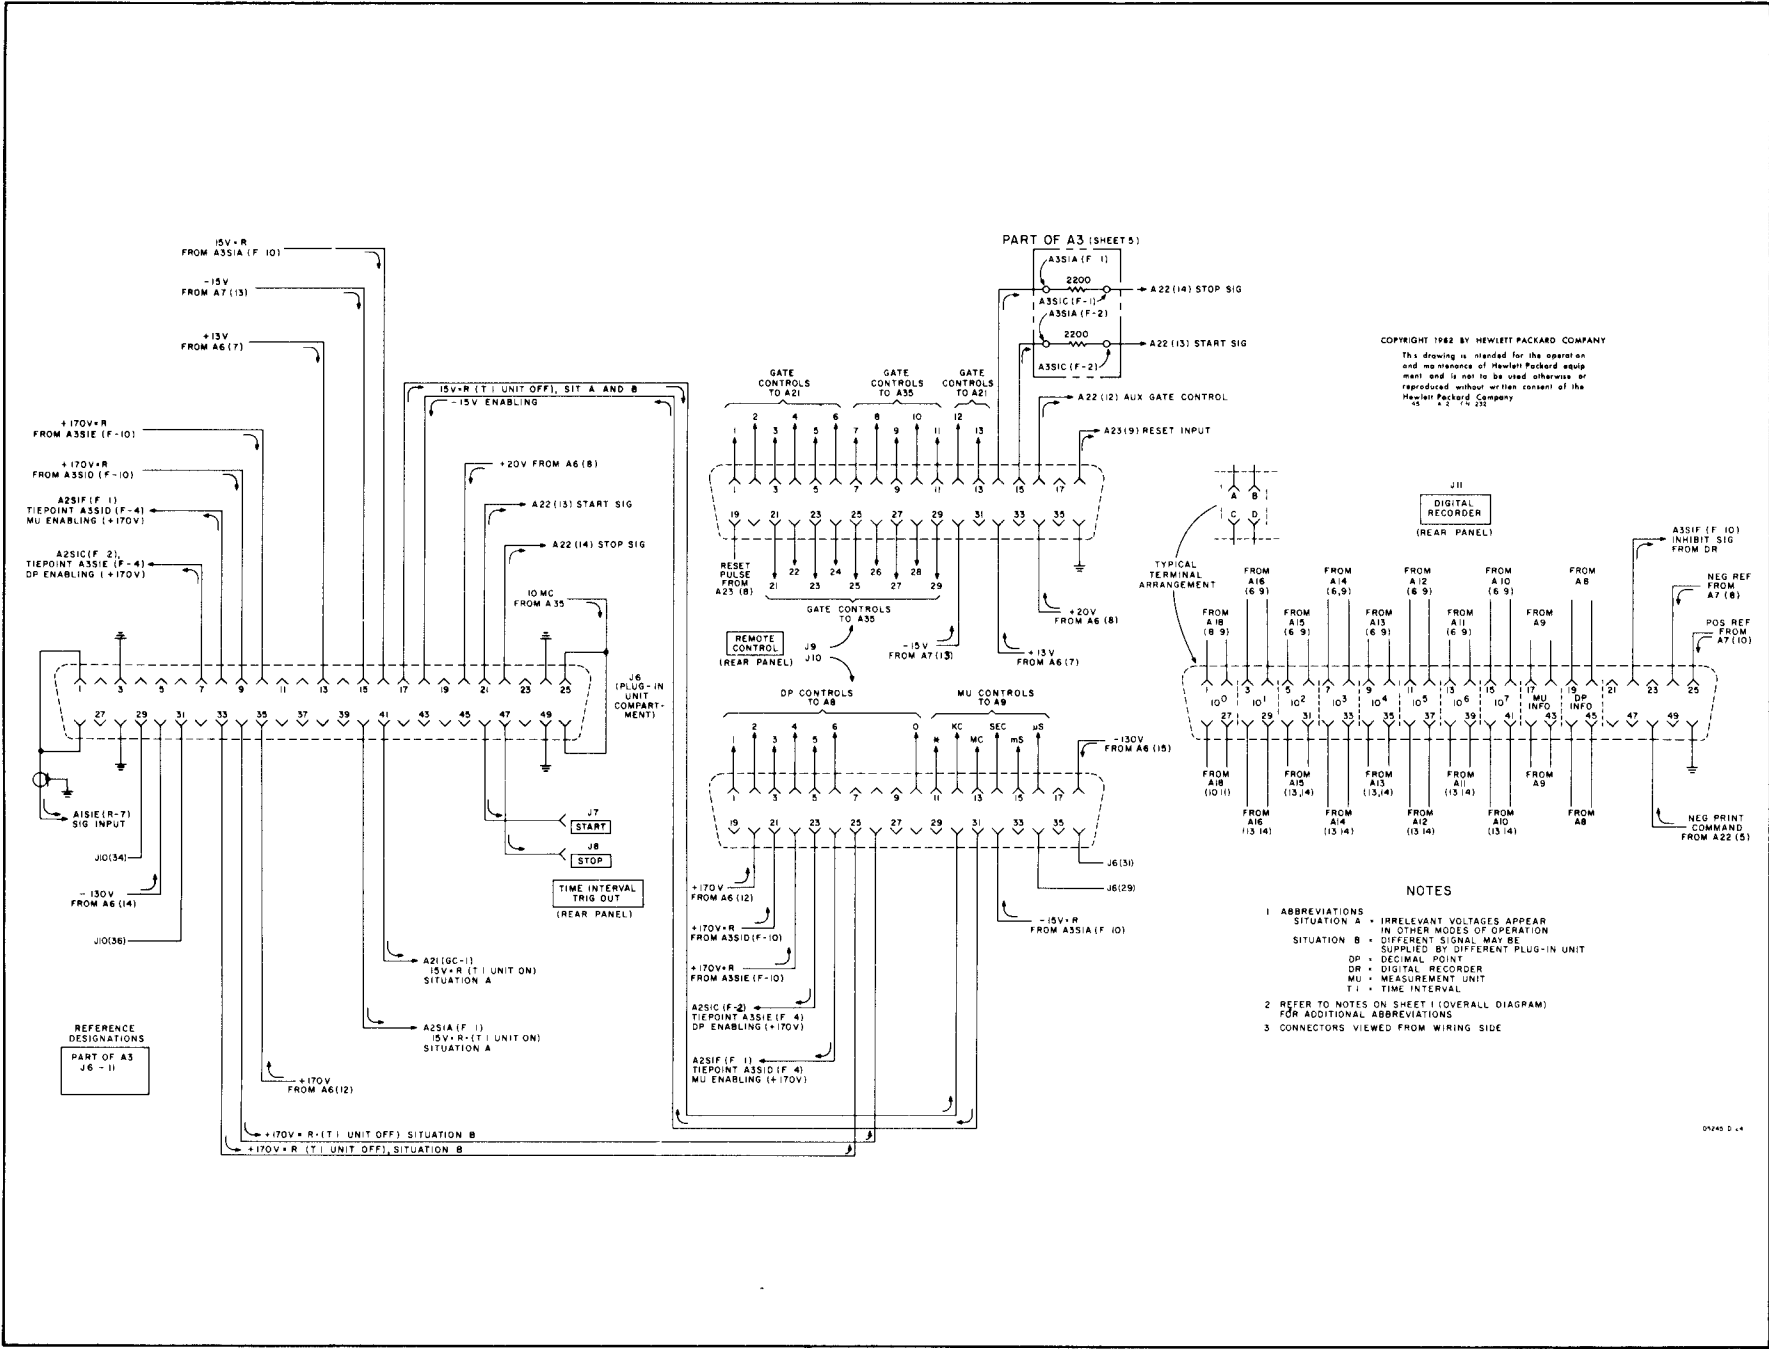

Figure 5-3. Remote Control Wiring and Connectors (Special)

Table 5-10. Manual Changes

Instrument Serial Prefix No.	Change No.
628-	1, 2
648-	2

CHANGE 1 Figure 7-9, Replace Figure 7-9 A10-A15 (05212-6016) with Figure 7-27 A10-A14 (5212L-4A).
 Table 4-1, Replace A10-A15 portion of Table 4-1 with Table 5-11 A10-A14. Change A15 to read A15 same as A16 prefix A15.
 Figure 7-11, Change prefix designation from A16 to A15, A16.
 Figure 7-12, Replace Figure 7-12 A15, A16 (05232-6014/6012) with Figure 7-28, A15, A16 (05232-6002/6003).
 Table 5-6, Replace Table 5-6 (05232-6014/6012) with Table 5-12 (05232-6002/6003).

CHANGE 2 Figure 7-3, Renumber the contacts on A1S1A (FRONT) and A1S1B (FRONT) as follows:

- Move contact 1 to 8
 - Move contact 2 to 1
 - Move contact 3 to 2
 - Move contact 4 to 3
 - Move contact 5 to 4
 - Move contact 6 to 5
 - Move contact 7 to 6
 - Move contact 8 to 7
- The change is the same for both wafers.

Figure 7-4, Change contacts as indicated:

- A2S1B (REAR)**
 - Move contact 1 to 4-1/2
 - Move contact 2 to 2-1/2
 - Move contact 8 to 8-1/2
- A2S1J (FRONT)**
 - Move contact 3 to 4
- A2S1J (REAR)**
 - Move contact 2 to 1
 - Move contact 11 to 10
 - Move rotor 1 position cw
- A2S1K (FRONT)**
 - Move contact 9 to 12
 - Move contact 11 to 2
 - Move contact 12 to 3
 - Move rotor 90° cw

Table 4-1, Change A1S1 to HP Part No. 3100-1860.
 Change A2S1 to HP Part No. 3100-0319.

SECTION VI

ADJUSTMENT AND TROUBLESHOOTING

6-1. INTRODUCTION.

6-2. This section provides maintenance, adjustments, and troubleshooting information for the Model 5245L Electronic Counter.

6-3. MAINTENANCE.

6-4. AIR FILTER. Inspect the air filter (center of rear panel) regularly and clean it before it becomes dirty enough to restrict air flow. Proceed as follows:

- a. Remove top cover (unlock the two quarter turn fasteners and slide cover to the rear).
- b. Remove four screws holding filter in place.
- c. Wash filter in warm water and detergent.
- d. Allow filter to dry completely.
- e. DO NOT APPLY ANY COATING COMPOUND TO NON-METAL FILTERS. Coat metal filters with light film of filter oil. We recommend No. 3 Filter Coat from Research Products Company. This adhesive is available in "Handi-Koter" sprayer cans at most heating supply stores or from your Hewlett-Packard Sales and Service Office.

6-5. FUSE REPLACEMENT. Table 6-1 lists fuse rating and HP Part No. for proper operation with either 115V or 230Vac.

Table 6-1. Fuse Replacement

Conversion	115 Volt	230 Volt
Slide switch	Left ("115")	Right ("230")
AC LINE FUSE	2 ampere slow-blow (HP 2110-0006)	1 ampere slow-blow (HP 2110-0007)

6-6. FAN MOTOR. Two drops of light machine oil should be applied to the fan motor shaft once a year.

6-7. TEST EQUIPMENT.

6-8. Recommended test equipment for adjustments and troubleshooting is listed in Table 6-2. Test instruments other than those listed may be used if their specifications are equal to or exceed the required characteristics.

6-9. ASSEMBLY CONNECTION IDENTIFICATION.

6-10. Throughout the manual, connections to printed circuit assemblies are referred to in abbreviated form. For example, the connection to pin 15 of assembly A6 is A6(15).

Table 6-2. Recommended Test Equipment

Instrument Type	Required Characteristics	Use	Instrument Recom..
Oscilloscope	50 MHz bandwidth, dual trace plug-in, ext sync capability	Observe waveforms during troubleshooting and adjustment. Performance Check.	HP Model 175A Oscilloscope HP Model 1750B Dual Trace Vertical Ampl HP AC-21C Voltage Divider Probe (two) HP 10003A 10:1 Probe
Test Oscillator	Continuously variable from 10 Hz to 50 MHz, 100 mV output	Performance Check Adjustments Troubleshooting	HP Model 204B Oscillator HP Model 606A Test Oscillator
Low Frequency Generator	Continuously variable from 2 Hz to 10 Hz, 100 mV output	Performance Check Troubleshooting	HP Model 202A Low Frequency Function Generator
Pulse Generator	1 μ sec wide, 1 V negative, 1 kHz repetition rate	Performance Check Troubleshooting	HP Model 212A Pulse Generator
DC Voltmeter	0V to \pm 170V, 10 megohm input impedance, 1% accuracy	Troubleshooting Adjustments	HP Model 412A
Digital to Analog Converter	1-2-2-4 BCD code	Performance Check Troubleshooting	HP Model 581A
Strip-Chart Recorder		Performance Check Troubleshooting	Moseley 680

6-11. INSTRUMENT COVER REMOVAL.

6-12. To remove top or bottom cover, unlock two quarter turn fasteners which secure cover to instrument. Then slide cover toward rear of instrument. To replace cover, reverse procedure.

WARNING

115/230 VAC AND DC SUPPLY WIRES ARE EXPOSED WHEN EITHER INSTRUMENT COVER IS REMOVED. EXERCISE CAUTION DURING TROUBLESHOOTING, ADJUSTMENT, OR REPAIR. REMOVE POWER FROM INSTRUMENT BEFORE REMOVING OR REPLACING COVERS OR ASSEMBLIES.

6-13. ASSEMBLY LOCATION.

6-14. Top and bottom internal views of the Counter are shown in Figures 6-5 and 6-6. These figures show the location of the assemblies, connectors, chassis parts and test points.

6-15. PRINTED CIRCUIT COMPONENT REPLACEMENT.

6-16. Component lead holes in the Model 5245L circuit boards have plated walls to ensure good electrical contact between conductors on the opposite sides of the board. To prevent damage to this plating and to the replacement component, apply heat sparingly and work carefully. The following replacement procedure is recommended.

- a. Remove defective component.
- b. Melt solder in component lead holes. Use clean dry soldering iron to remove excess solder. Clean holes with toothpick or wooden splinter. Do not use metal tool for cleaning as this may damage through-hole plating.
- c. Bend lead of replacement component to the correct shape and insert component leads into component lead holes. Using heat and solder sparingly, solder leads in place. Heat may be applied to either side of board. A heat sink (longnose pliers, commercial heat-sink tweezers, etc) should be used when replacing transistors and diodes in order to prevent conduction of excessive heat from the soldering iron to the component.
- d. Through-hole plating breaks are indicated by the separation from the board of the round conductor pad on either side of the board. To repair breaks, press conductor pads against board and solder replacement component lead to conductor pad on both sides of the board.

6-17. ADJUSTMENTS.

6-18. REGULATOR ASSEMBLY A7.

CAUTION

When troubleshooting or adjusting the power supply, do not short supplies to ground or to each other. This will damage the diodes and transistors.

- a. Set line voltage to normal value (115 or 230 Vac).
- b. Connect dc voltmeter (Table 6-2) to buss wire between A16(11) and A18(6).
- c. Voltmeter should read +20 Vdc \pm 0.5 Vdc. If voltage is outside this range, adjust A7R17 (Figure 7-7).
- d. Vary line voltage from 103 to 127 Vac (207 to 255 Vac). The +20 Vdc supply should not vary more than 0.5 Vdc.
- e. Check all supply voltages at locations, and under conditions shown in Table 6-4.

Note

Input sensitivity levels must be rechecked if power supply voltages are readjusted.

Table 6-4. Power Supply Voltages

Test Point	Line Voltage			Adjustment
	103	115	127	
A6(15)	-120 \pm 10%	-130 \pm 10%	-150 \pm 10%	None
A6(12)	+160 \pm 10%	+170 \pm 10%	+180 \pm 10%	None
A7(13)	- 15 \pm .5	- 15 \pm .5	- 15 \pm .5	R5
A7(4)	+ 13 \pm .5	+ 13 \pm .5	+ 13 \pm .5	R12
A16(11)	+ 20 \pm .5	+ 20 \pm .5	+ 20 \pm .5	R17
A7(8)	-6.9 \pm 1	-6.9 \pm 1	-6.9 \pm 1	Depends on adjustment of +20 vdc and -15vdc above
A7(10)	+17.6 \pm 1	+17.6 \pm 1	+17.6 \pm 1	

6-19. INPUT AMPLIFIER A19.

6-20. The following procedure sets the output level and checks the gain, frequency response, and sensitivity of the input amplifier.

a. Turn counter on and set LEVEL to PRESET; SENSITIVITY to .1V.

b. With no input connected, measure the output dc voltage at A19(6).

c. Adjust dc voltage with A19R20 to +6.3V \pm .2V.

d. Connect output of Test Oscillator to Counter DC INPUT connector with 50-ohm termination at Counter.

e. Set Test Oscillator output to 50 kHz at 100 mV rms.

f. Check output at A19(6) with Oscilloscope; output should be 1.5V p-p minimum.

g. Increase output of Test Oscillator to 3V rms. The output at A19(6) is a symmetrically clipped waveform approximately 2V p-p.

h. Set SENSITIVITY to .1V, TIME BASE to 10 ms, and FUNCTION to FREQUENCY.

i. Set Test Oscillator output to 50 MHz at 100 mV rms.

j. Adjust A19R20 until correct count appears. Reduce input signal amplitude and readjust A19R20 for maximum sensitivity.

6-21. RATIO INPUT AMPLIFIER A20.

6-22. Repeat steps a through g in Paragraph 6-20. Change A19(6) to A20(6).

a. Set SIGNAL INPUT SENSITIVITY to 1V range, TIME BASE to EXT., and FUNCTION to 1 PERIOD AVERAGE. Set OUTPUT STANDARD FREQUENCY (rear panel) to 100 Hz. Connect a coaxial cable from OUTPUT STANDARD FREQUENCY (rear panel) to AC SIGNAL INPUT (front panel).

b. Connect output of Test Oscillator 50 MHz at 100 mV to Counter EXT. TIME BASE through 50-ohm termination.

c. Adjust A20R20 until correct count appears. Reduce input signal amplitude and readjust A20R20 for maximum sensitivity.

6-23. FUNCTION CONTROL A21.

a. Set TIME BASE to .1 μ s and FUNCTION to 1 PERIOD AVERAGE.

b. Set Test Oscillator to 1 MHz at 100 mV and connect to the Counter AC SIGNAL INPUT connector.

c. Observe correct count on counter. Reduce the Test Oscillator output and adjust A21R31 for maximum sensitivity.

Note

Do not change the setting of the output level control A19R20.

6-24. OSCILLATOR FREQUENCY CHECK.**6-25. TIME-BASE OSCILLATOR FREQUENCY.**

6-26. GENERAL. The frequency accuracy of the oscillator may be determined by observing the rate of drift of the oscilloscope pattern (Figure 6-1). If the pattern moves to the right, counter oscillator frequency is lower than the standard frequency being used to trigger the oscilloscope. If the pattern moves to the left, oscillator frequency is high. The reciprocal of the time in seconds for the oscilloscope pattern to move the width of one cycle equals the frequency difference in parts in 10^6 with 1 MHz inputs (or parts in 10^5 with 100 kHz inputs). For example, if the oscilloscope pattern drifts to the left a rate of one cycle's width every 10 seconds with 1 MHz inputs, the oscillator frequency is 1 part in 10^7 high. If the pattern moves the width of one cycle in 100 seconds, frequency error is 1 part in 10^9 with 10 MHz inputs. If the pattern moves the width of one cycle in 10 seconds with a 10 MHz input, the frequency error is 1 part in 10^8 . Movement of the pattern may be accurately checked using an oscilloscope with calibrated sweeps by timing the movement of the point at which the oscilloscope trace crosses the base line when horizontal sweep is expanded and vertical gain is increased.

6-27. To check oscillator frequency, proceed as follows:

a. Connect oscilloscope to OUTPUT STD FREQ BNC and set MODE switch to INT STD FREQ.

b. Trigger oscilloscope externally with a 1 MHz signal from a standard frequency source.

c. Set oscilloscope sweep time to .1 μ s/cm. Adjust oscilloscope controls to obtain a presentation of a 5V peak-to-peak nonsinusoidal waveform.

d. Horizontal drift of oscilloscope display in cm/sec is difference between standard frequency and counter time-base frequency in parts in 10^7 .

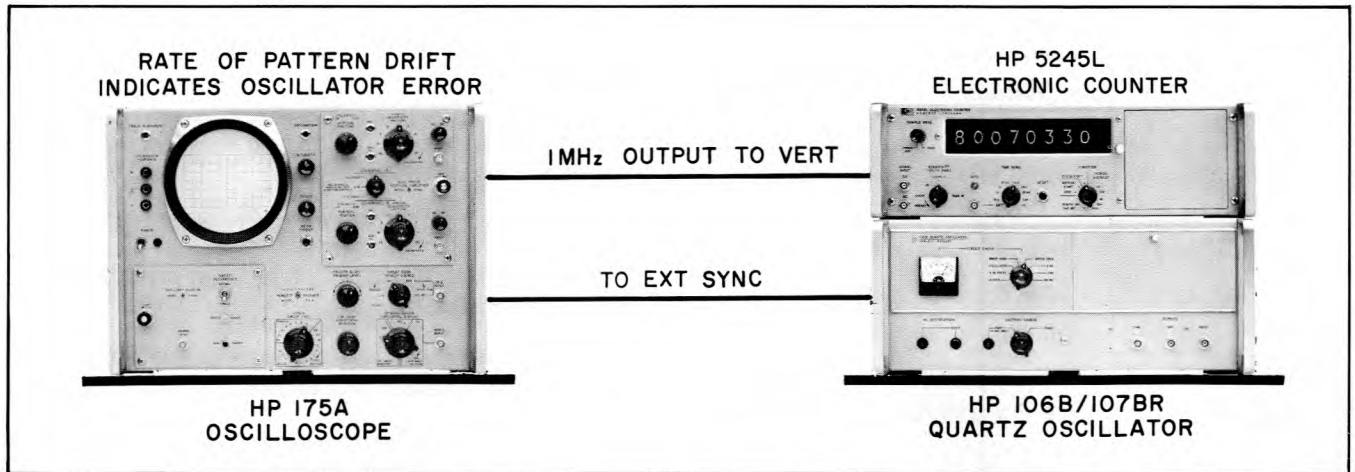

Figure 6-1. Test Setups for Checking Oscillator Frequency

e. Determine frequency difference in parts in 10^7 and record.

f. If frequency difference is excessive for the desired application of counter, see Paragraph 4-11 for time-base oscillator frequency adjustment procedure.

g. Note and record environmental temperature.

h. Repeat above steps a through g at daily intervals. Change in frequency difference between standard frequency and time-base oscillator frequency per day is frequency drift of time-base oscillator. Drift should not exceed ± 3 parts in 10^9 per day under reasonably constant environmental conditions (see Table 1-1).

6-28. OSCILLATOR CALIBRATION.

a. Connect 100 kHz output of Quartz Oscillator to EXT SYNC input on Oscilloscope.

b. Connect 1 MHz signal from OUTPUT STD FREQ BNC on rear panel of the 5245L to VERT INPUT on Oscilloscope.

c. Adjust COARSE FREQUENCY capacitor from rear panel until pattern on the oscilloscope stops drifting.

d. If necessary adjust MED or FINE FREQ ADJ (at rear of plug-in compartment) until average drift of oscilloscope pattern is zero.

6-29. TROUBLESHOOTING.

6-30. TROUBLESHOOTING AIDS.

6-31. OPERATING MANUAL. The Operating Manual provided with the HP 5245L provides general information about the instrument and its capabilities. Refer to the Operating Manual for specifications, installations, step-by-step operating procedures, and a quick operator's check of instrument operation.

6-32. PRINCIPLES OF OPERATION. Section II provides valuable information on how the instrument and its circuits function.

6-33. SCHEMATIC DIAGRAMS. Schematic diagrams and a block diagram are provided in Section VII.

6-34. COMPONENT LOCATION. Photographs are provided with the schematic diagrams to aid in locating components on switches or circuit boards.

6-35. TROUBLESHOOTING "TREE". A step-by-step troubleshooting procedure is provided on pages 6-11 through 6-14. This procedure is based on the self check feature of the instrument and makes maximum use of front panel controls and indicators.

6-36. SELF CHECK TABLES. Table 6-8 provides 33 unique combinations of Go-No-Go situations possible in the Self Check function. Circuit elements to be checked are indicated for each combination. Table 6-6 lists assemblies checked in Self Check functions.

6-37. TROUBLESHOOTING PROCEDURE.

6-38. MALFUNCTION AT TURN ON. If counter fails to turn on (no display, decimal point, or measurement units) make the following checks:

- Line voltage switch set for power source.
- Power cord plugged into counter and power source.
- Line fuse good.
- Ac power available at source.
- Power supply (A6, A7, T2, L1, L2, C5).

6-39. MALFUNCTION DURING SELF CHECK. If counter malfunctions in some, but not all, check functions, see Table 6-8 for probable cause. If counter will not self-check for any function, see Troubleshooting "Tree", Table 6-7.

6-40. MALFUNCTION DURING OPERATION. If the counter will turn on, but malfunctions when operation is attempted, switch to Self Check for the function and time base desired. If counter will Self Check but will not function with an external signal, check setting of SENSITIVITY and LEVEL controls, input signal level, and connections to counter.

6-41. If counter will function in FREQUENCY mode but not in PERIOD (below 1 MHz) check control gate 5 (A21CR5, CR11). If counter will function in PERIOD but not in FREQUENCY, check control gate 2 (A21CR3, CR9). If counter malfunctions in both PERIOD and FREQUENCY, but self checks in both functions, check input attenuator and input amplifier.

6-42. If counter malfunctions when operation is attempted and fails to self-check in the function desired see Paragraph 6-39.

1. Turn SAMPLE RATE control clockwise from POWER OFF position to turn counter on.
2. Set SENSITIVITY switch to CHECK.
3. Set LEVEL control to PRESET.
4. Set FUNCTION switch to FREQUENCY.
5. See table below for proper display (± 1 count) for each position of TIME BASE switch.

6. Set FUNCTION switch to MANUAL START. Counter should count continuously at frequency selected on TIME BASE switch.
7. Set FUNCTION switch to 1 PERIOD AVERAGE.
8. See table below for proper display (± 1 count) for each PERIOD AVERAGE position of the FUNCTION switch.

TIME BASE	DISPLAY	PERIOD AVERAGE	DISPLAY
1 μ s	0000010. MHz	1	00000001
10 μ s	0000010.0 MHz	10	00000010

The following assemblies are checked in all positions used in the Self-Check Table:

6, 7, 17, 18, 21, 22, 23, 24, 25, 26, and 35.

Assemblies 8 and 9 are checked in all Frequency Self-Checks.

The SENSITIVITY switch (A1) is in the check position for all Self Check functions.

Assemblies 4, 5, 19, 20, are not checked in Self Check functions.

Assembly A26 is checked for operation, but not for accuracy or stability.

1. **SAMPLE RATE**
 - a. Controls power to all circuits except crystal oven heater; max ccw turns POWER OFF.
 - b. Controls time between measurements from 0.2 sec to 5 sec.
 - c. Causes display to HOLD indefinitely when maximum cw.
2. **DC SIGNAL INPUT** provides direct coupling to internal amplifier for most measurements.
3. **AC SIGNAL INPUT** provides coupling to internal amplifier through .022 μ f (600 vdc maximum).
4. **SIGNAL INPUT SENSITIVITY & LEVEL** control.
 - a. Controls input attenuator; set to highest position which includes signal amplitude (max overload; 50v in position 0.1, 150v in position 1; 500v in position 10).
 - b. Maximum CCW (CHECK position) gives internal self check; counts 10 MHz with selected TIME-BASE gate for FREQUENCY; 100 kHz for number of periods averaged (10 μ sec to 1 sec) for PERIOD AVERAGE, or continuously at selected TIME BASE frequency (0.1 Hz to 10 MHz) for MANUAL START.
 - c. Maximum CW (PLUG-IN position) connects output of plug-in unit directly to input amplifier.
 - d. The LEVEL control adjusts the input trigger level from -0.3V dc to +0.3V dc when attenuator is set at 0.1V rms, from -3.0V dc to +3.0V dc when attenuator is set at 1V rms, and -30V dc to +30V dc when attenuator is set at 10V rms.
 - e. Maximum counterclockwise position (PRESET) sets trigger level at zero volts.
5. **GATE** lamp glows during counting (main gate open).
6. **EXT** connector
 - a. Provides input for higher of two frequencies for ratio measurement (lower frequency to SIGNAL INPUT) when TIME BASE set to EXT.
 - b. Provides output frequency 0.1 Hz to 1 MHz as selected by TIME-BASE switch (see text for restrictions).
7. **TIME BASE** selects either time that main gate is on for frequency or time unit per count for period measurement.
8. **RESET** pushbutton returns both displayed and internal count to zero when pressed.
9. **FUNCTION**
 - a. Permits totalizing of pulses applied to SIGNAL INPUT when set to MANUAL START; holds accumulated count when switched to MANUAL stop.
 - b. Permits measurement of frequency applied to SIGNAL INPUT during interval selected by TIME-BASE switch when in FREQUENCY.
 - c. Permits period measurement of waveforms applied to SIGNAL INPUT averaged over 1 to 100,000 periods when set to PERIOD AVERAGE.
 - d. Removes control of TIME-BASE and FUNCTION switches when set to REMOTE or TIME INT; remote control is provided through rear connector or plug-in unit.

Figure 6-3. Operating Controls (Front Panel)

10. Plug-in compartment
 - a. Receives plug-in unit to extend basic counter capabilities. To install plug-in (1) turn power off, (2) loosen knurled screw at side of compartment, (3) remove blank panel or plug-in unit, (4) slide desired plug-in unit into place and tighten knurled screw.
 - b. Permits access to fine and medium frequency controls through panel at rear of compartment; FINE FREQ ADJ has range of about 5×10^{-8} ; MED FREQ ADJ has range of about 1×10^{-6} .
11. COARSE FREQ ADJ permits adjustment of oscillator over a range of about 1×10^{-5} .
12. MODE
 - a. Permits use of external 1-Mc frequency standard for time-base control when set to EXT STD FREQ (1 MHz).
 - b. Permits normal operation of counter using internal oscillator when set to INT STD FREQ.
 - c. Permits scaling of input signal by factors of 10 when set to SCALER.
13. OUTPUT
 - a. Supplies selected frequency when MODE is set to INT STD FREQ (see text for restrictions).
 - b. Supplies scaled input frequency when MODE is set to SCALER.
14. STORAGE switch provides display storage when up; continuous display of internal count when OFF (down).
15. AUX A/AUX B (TIME INTERVAL TRIGGER OUT - START/STOP). Auxiliary plug-in outputs. See appropriate plug-in manual.
16. Fuse provides overload protection; should be 2 ampere slow-blow for 115-volt operation; 1 ampere slow-blow for 230-volt operation.
17. Line-voltage switch permits selection of either 115- or 230-vac line; insert narrow blade and slide to left for 115 v, slide to right for 230v.
18. AC LINE connector connects to flat plug on power cable.
19. DIGITAL RECORDER connector supplies BCD information to recorder, analog converter, or data processing equipment.

FREQUENCY MEASUREMENTS

Frequency is defined as the number of occurrences of a particular phenomenon in some length of time. Figure 6-7 shows the logic block diagram for a counter in the FREQUENCY mode. There are two signals that need to be traced - the input signal, or measured frequency, and the gating signal, which determines the length of time during which the DCA's are allowed to accumulate pulses.

The input signal is passed through an AND gate (which is enabled when the function switch is in the FREQUENCY mode) to a Schmitt trigger. Here it is converted into a square wave with rapid rise and fall time, then differentiated and clipped. As a result, the signal which arrives at the main gate consists of a series of pulses separated by the period of the original input signal.

All the DCA's and DDA's in hp counters with the exception of the 50 MHz DCA in the 5245L use PNP transistors. Hewlett-Packard's practice is to count pulses in these decades which will turn a conducting transistor off so that loop gain and regeneration occur immediately. The 5245L is the only counter where the pulses passed through the main gate to the first DCA are negative. The 50 MHz DCA will produce positive pulses which are counted in the next DCA.

The time base output of 1 MHz is shaped so that positive spikes 1 microsecond apart are fed through the number of DDA's required to provide the selected gate time. In the example shown, six DDA's are used for a 1 second gate. The first output pulse passes through AND gate 12 (also enabled in the FREQUENCY mode) and a Schmitt trigger to the "Gate Flip-Flop". The Gate Flip-Flop assumes a state such that an enable signal is applied to the Main gate - since this is an AND gate, the input signal pulses are allowed to enter the DCA's and are totalized. This continues until the second pulse from the DDA's arrives at the "Gate Flip-Flop". The element changes and reverts to a state which removes the enable signal from the main gate, so that it closes and no further pulses are admitted. The DCA's are now in a state which corresponds to the number of input pulses received during a precise time interval which was determined by the time base. This BCD state is then analyzed by means of a decoding matrix, converted to decimal information, and fed to the display. If an hp 562A Digital Recorder is used with the counter, the reading is fed out directly in BCD form and decoded in the recorder.

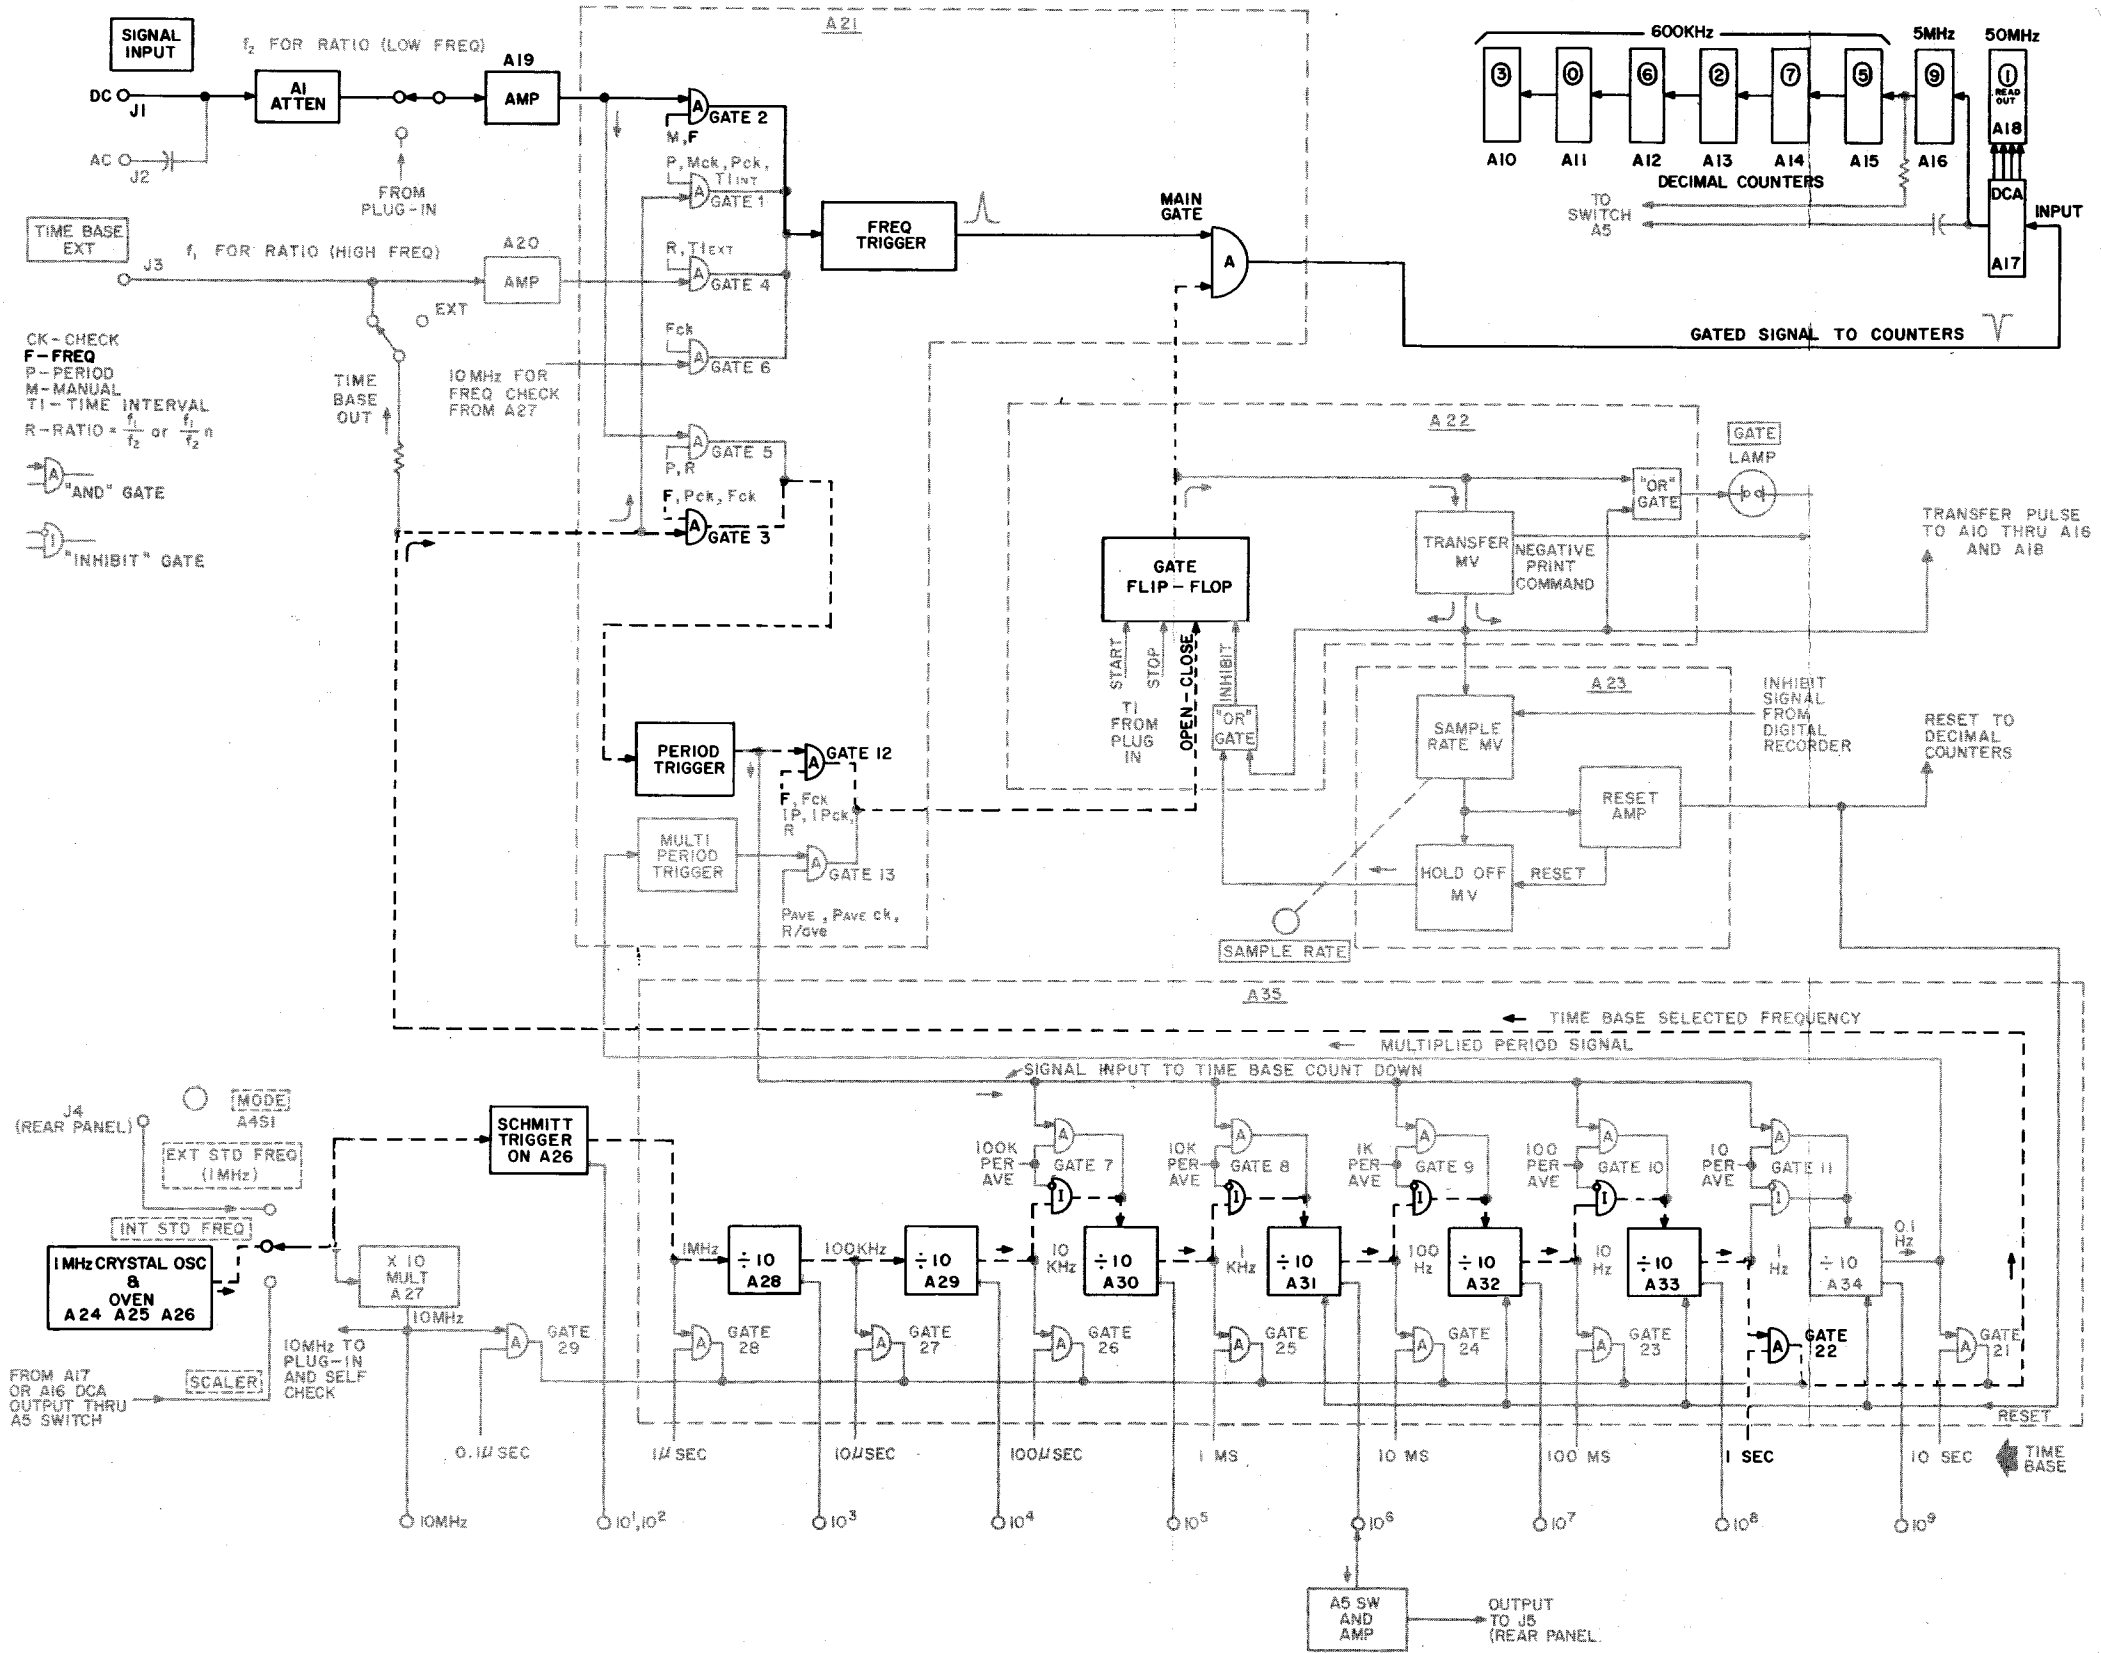

Figure 6-7. Frequency Measurements

SINGLE PERIOD MEASUREMENTS

Period is defined as the time required for one cycle to occur - literally, the inverse of a frequency measurement. Accordingly, the circuitry required for a period measurement must, in effect, reverse the counted and gated signals. Figure 6-8 shows that the gating signal is, in fact, derived from the unknown input signal. It should be noted, however, that the counted signal is not only derived from the time base but is also divided by the DDA's. This is in contrast to frequency measurements where the gating signal derived from the time base is divided in the DDA's. In short, the precisely spaced pulses from the time base are counted for one period of the unknown frequency. In our example, the time base switch is set to 1 s and the number of pulses which occur during one period of the unknown signal are counted and displayed. The gate time is always equal to the period of the unknown signal.

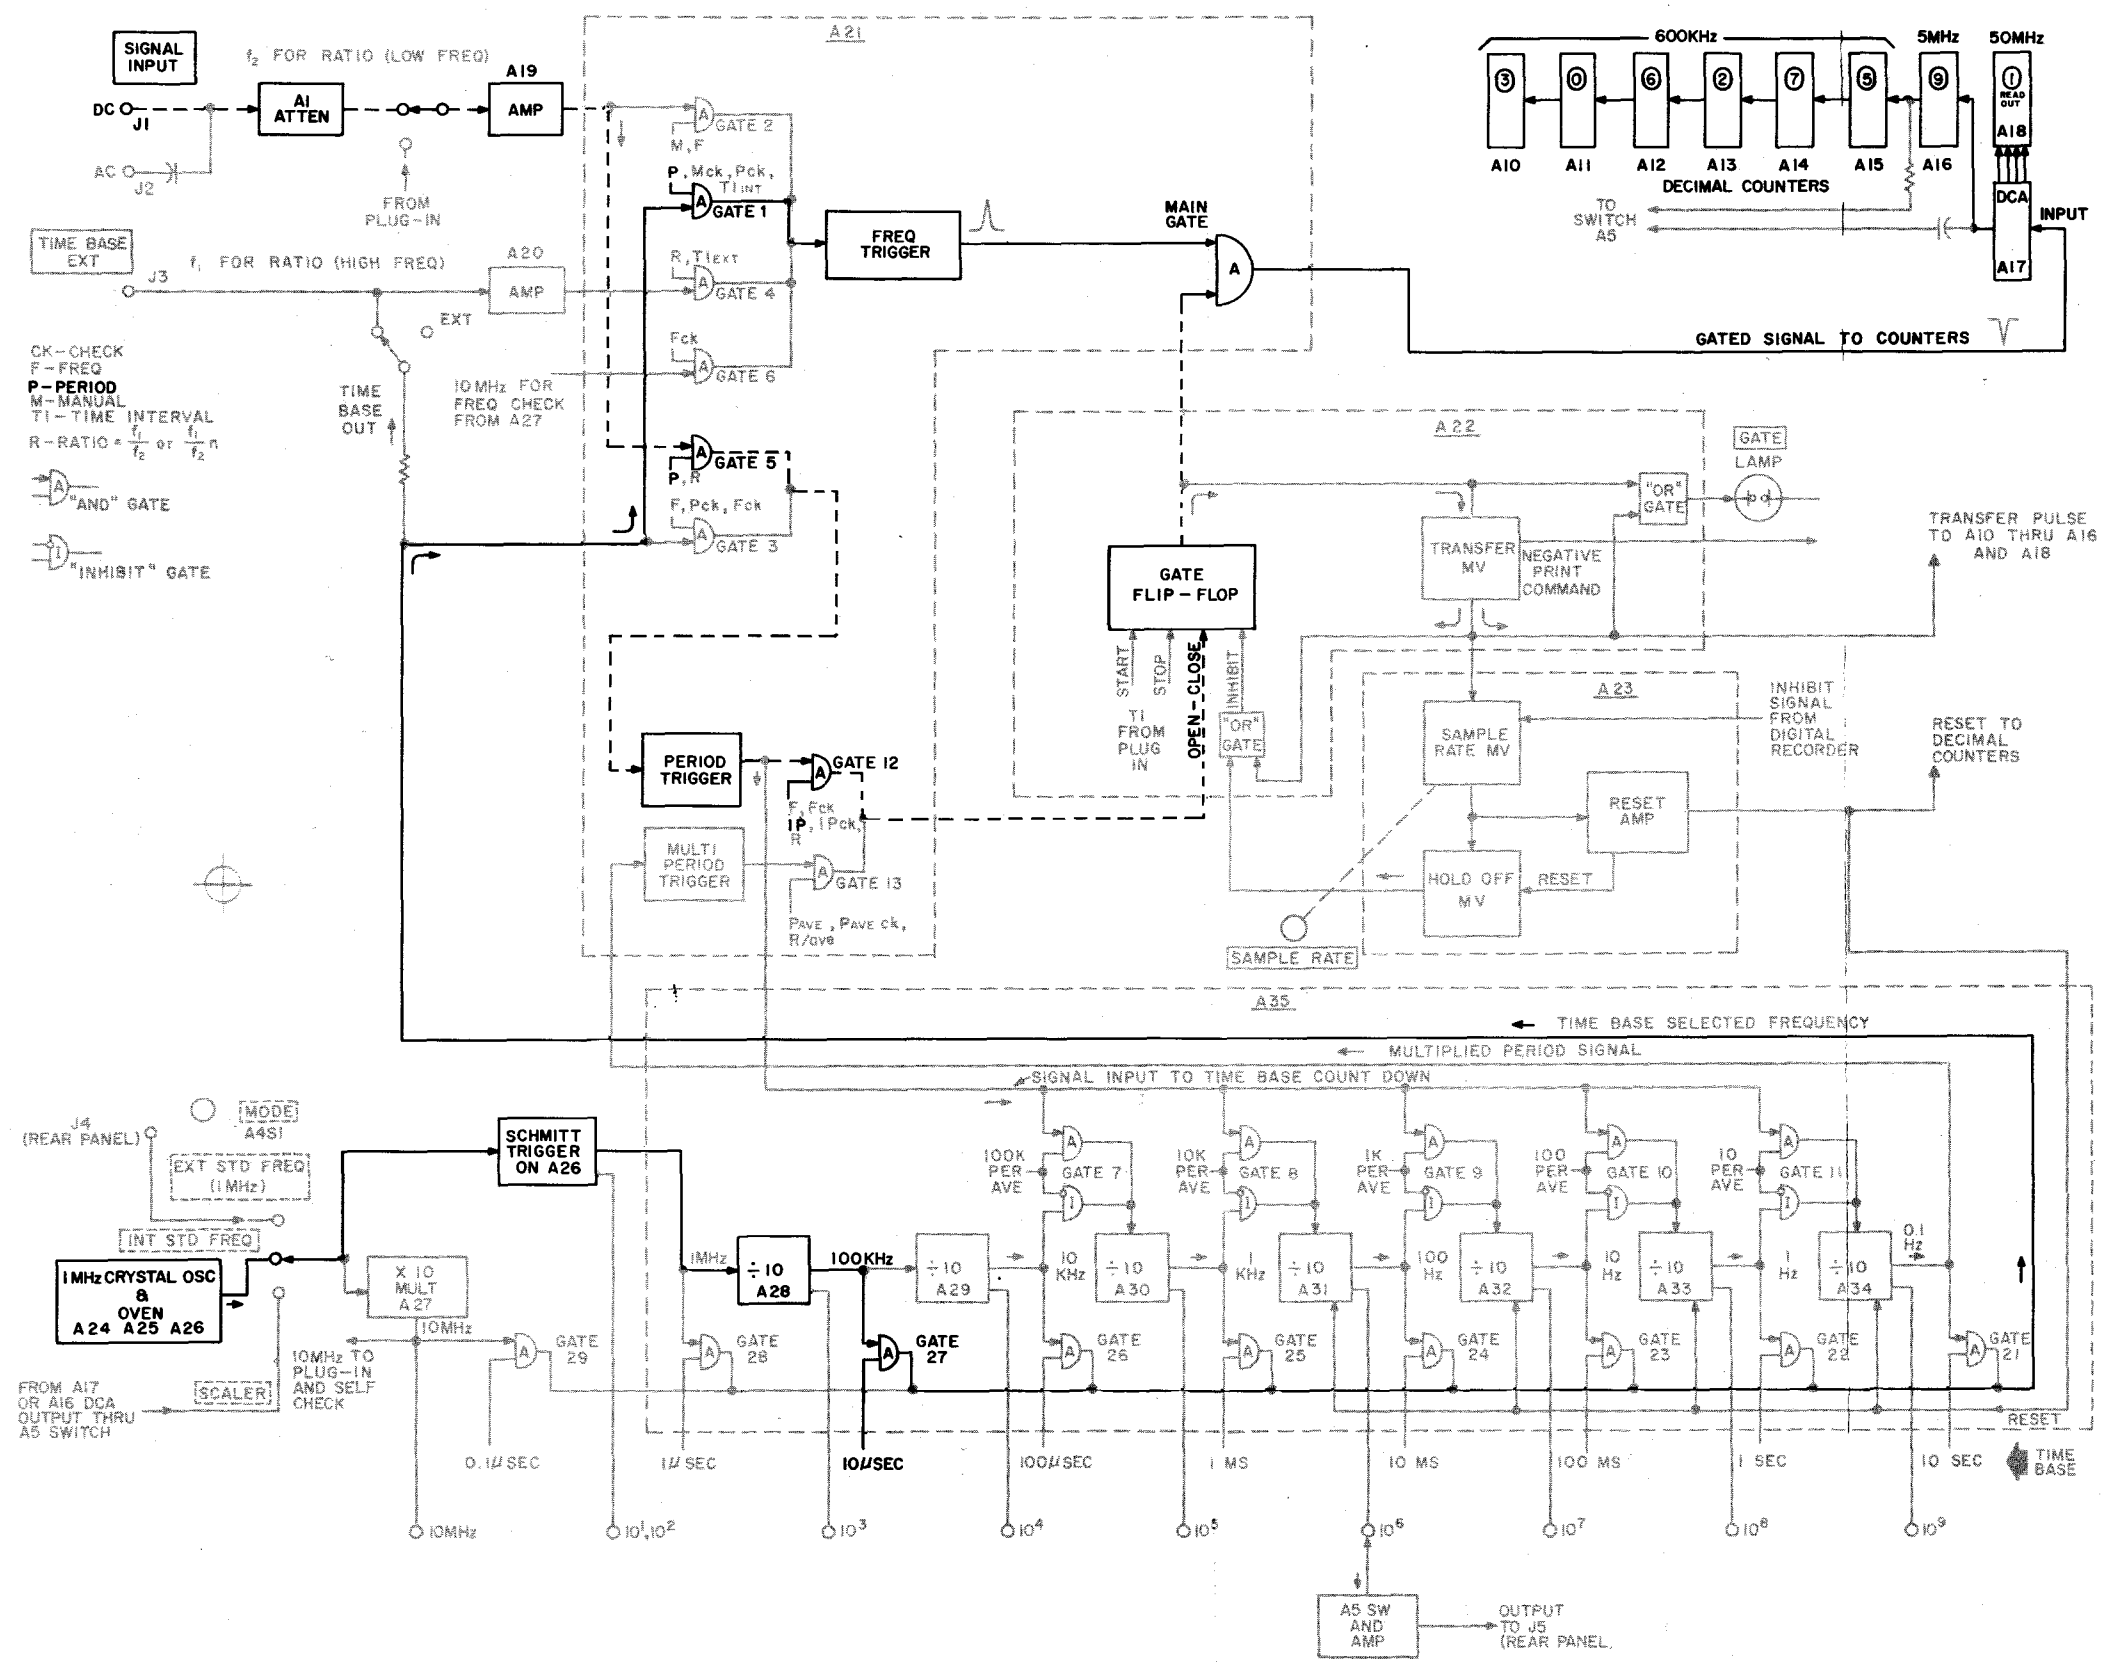

Figure 6-8. Single Period Measurements

MULTIPLE PERIOD AVERAGE MEASUREMENTS

This type of measurement is similar to a single period measurement in that the gating signal is derived from the unknown input signal and the counted signal is derived from the time base oscillator. The basic difference is that the gate may be held open for more than one period of the unknown signal. This is accomplished by the addition of an INHIBIT gate and an AND gate between selected DDA's (see Figure 6-9). This arrangement permits the unknown gating signal to be passed through certain DDA's and the counted time base signal to be passed through others. Any DDA's which are not used by the gating signal may be used to extend the separation of the counted pulses. In the example in Figure 6-9 there are seven DDA's - a maximum period average of 10^5 periods is available. The time base frequency is 1 MHz. The unknown signal is passed through suitable trigger and clipping circuits, then through the AND gate which is enabled when the Function Selector is in the 100K period average position. The signal is then passed through five DDA's so that there is one output pulse for every 10^5 input pulses; i. e., the period has been extended by a factor of 10^5 . As usual, the first output pulse enables the Main Gate and the second output pulse closes the Main Gate. The time base signal is shaped and then passed through a number of unused DDA's determined by the Time Base Selector setting. For example, if the setting is 10 microseconds, the signal will pass through one DDA. The maximum time base setting under the given circumstances is 0.1 milliseconds since the Inhibit gate will prevent the signal from passing on to the next DDA when the Function Switch is in the 100K Period Average. These precisely spaced pulses are then passed through the main gate to the DCA's. Since the 10 microsecond position was selected, the DCA's will count the number of 10 microsecond intervals which occur during 100,000 periods of the input signal. The readout logic is so designed that the decimal point will be automatically positioned to display the proper units.

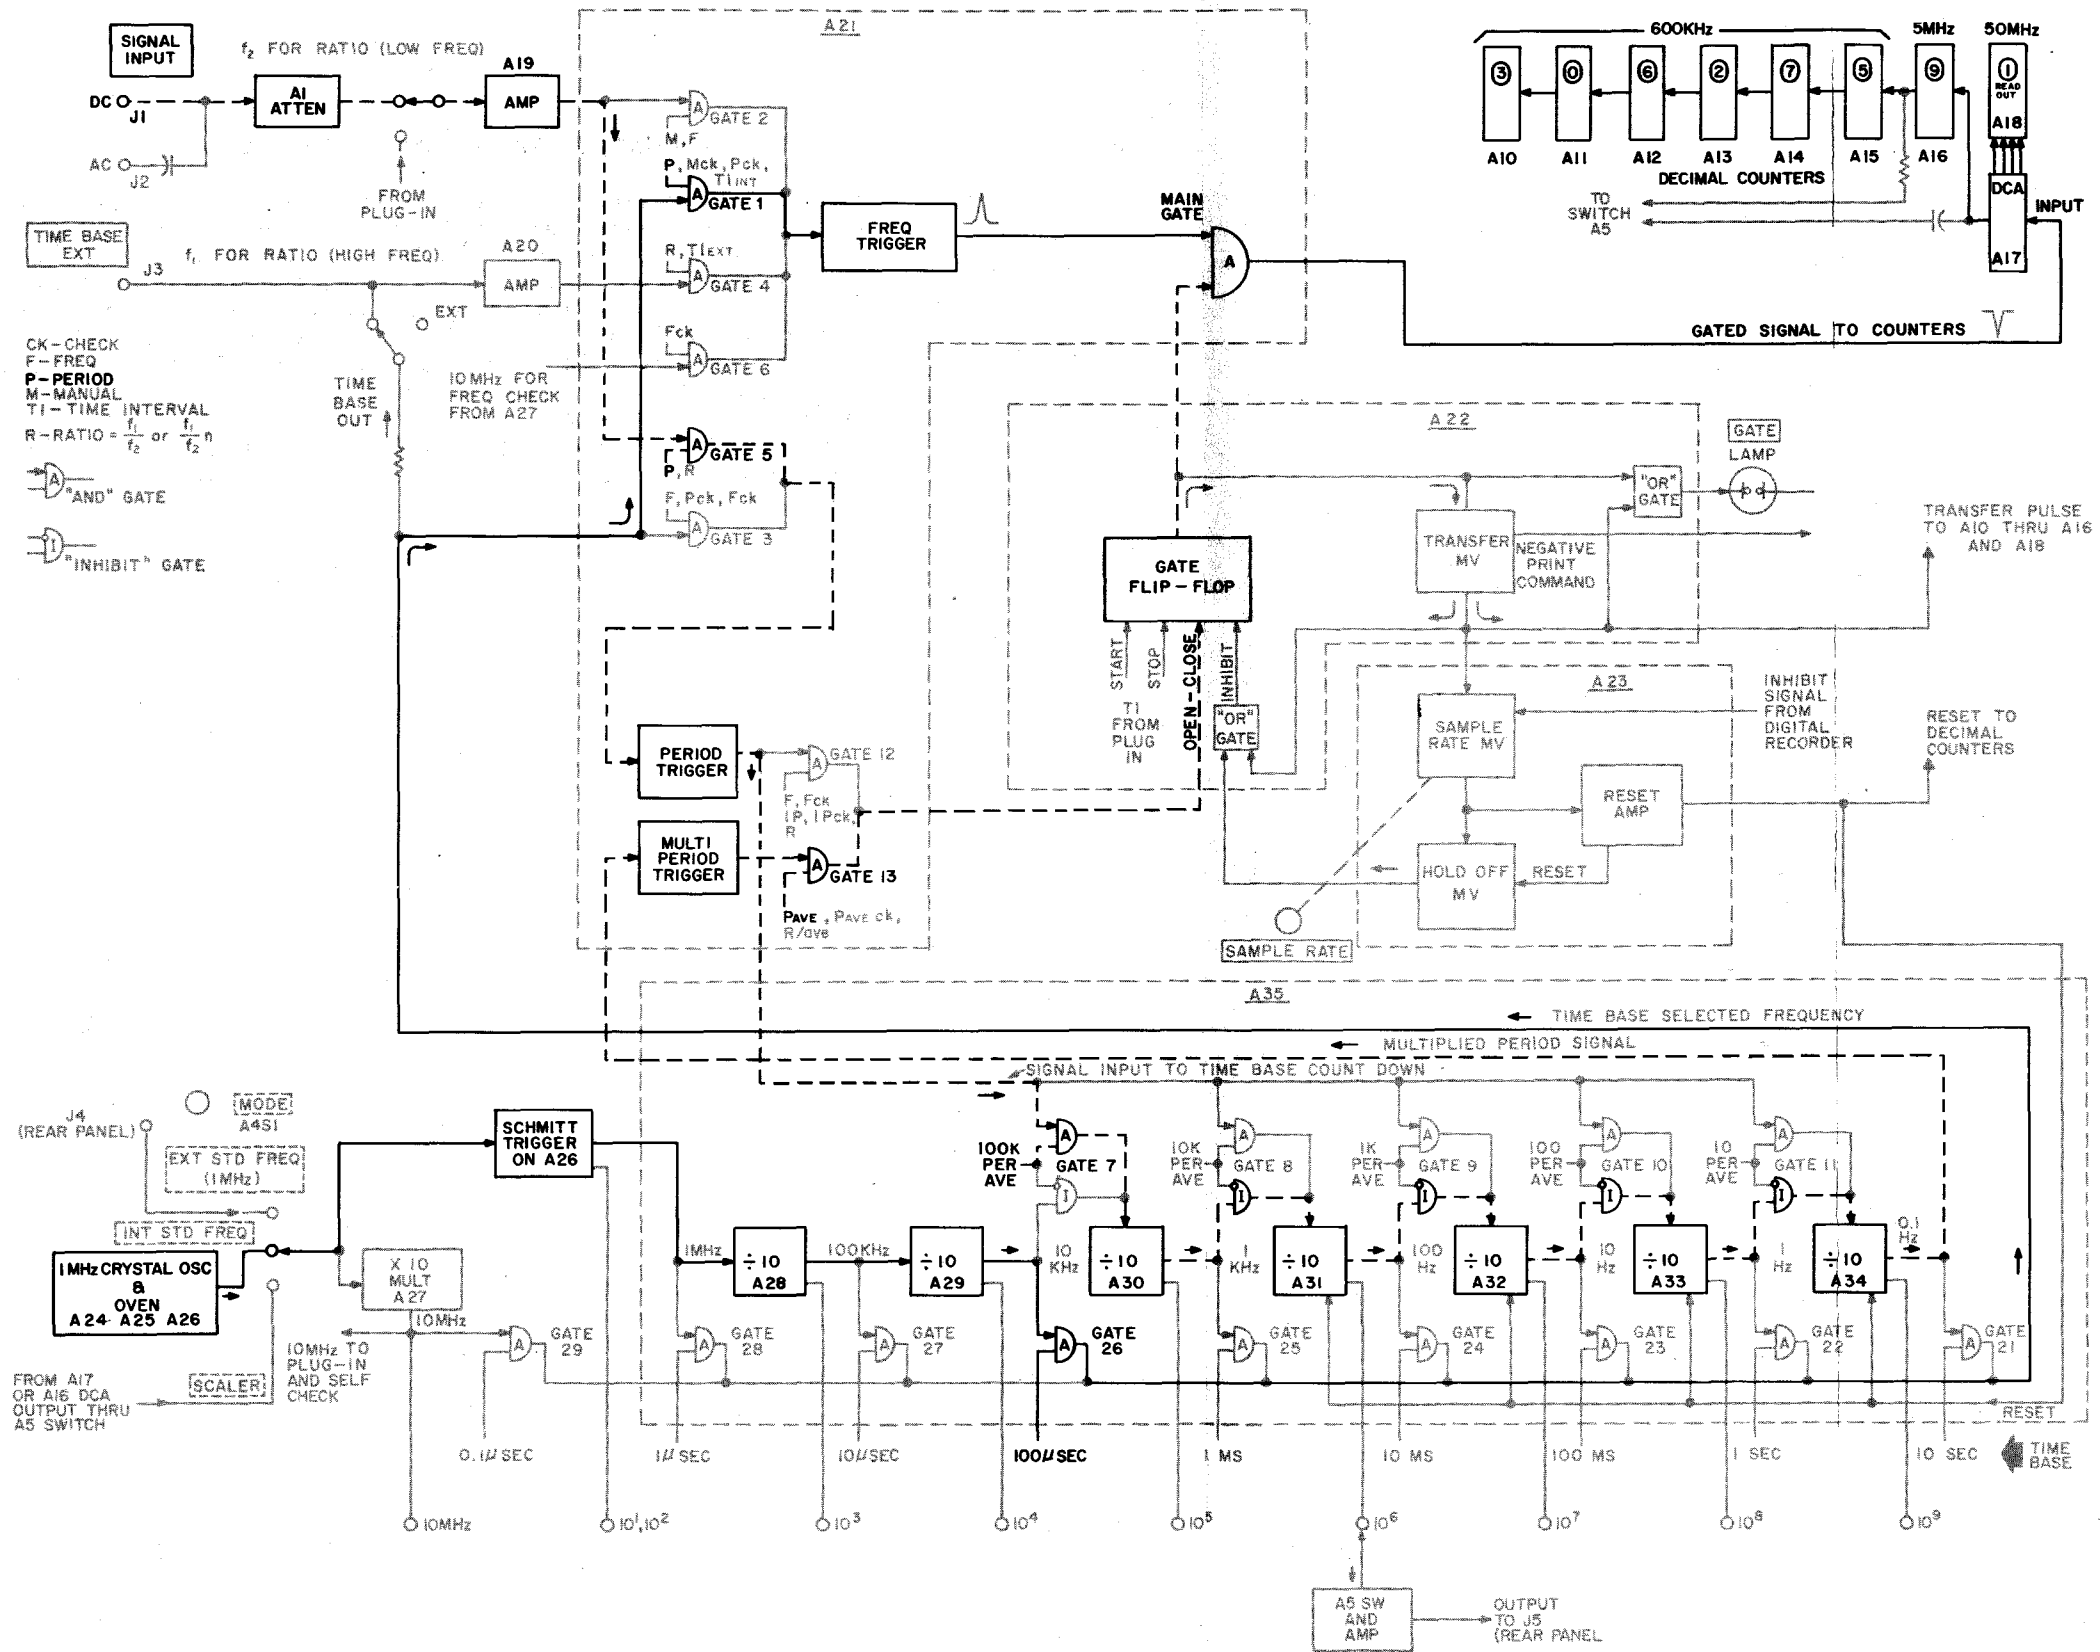

Figure 6-9. Multiple Period Average Measurements

RATIO AND MULTIPLE RATIO MEASUREMENTS

A ratio measurement is, in effect, a period measurement with the lower of the two frequencies used as the gating signal and the higher frequency signal used as the counted signal. In other words, the higher frequency signal takes the place of the time base. The number of cycles of the higher frequency signal f_1 which occur during a period of the lower frequency f_2 is counted in the DCA's. A multiple ratio measurement simply extends the number of periods of the lower frequency to 10, 100, etc. The decimal point is automatically positioned but no units are displayed since ratio is unitless. The block diagram of Figure 6-10 applies. Note that the standard selector is in the external (E) position and f_1 takes the place of the internal oscillator.

Figure 6-10. Ratio and Multiple Ratio Measurements

SCALING

With the Function Selector in the Manual Start position and the Mode selector on the rear of the instrument in the Scaler position, an input signal may be scaled down by factors of 10 through 1,000,000,000. The Manual Start position holds the main gate open. The input signal is converted to pulses and passed through the main gate and through the 50 MHz DCA where the first division by ten is accomplished.

With the rear panel Mode Selector in the Scaler position, and the Output Switch in the 10 position, the output of the 50 MHz DCA is passed through the time base Schmitt trigger and an amplifier and is made available at connector J5 on the rear of the instrument. With the Output Selector on any position other than 10^1 (e.g., 10^2 through 10^9) the signal is passed through both the 50 MHz and the first 5 MHz DCA to the time base Schmitt. It is then routed through a selected number of DDA's.

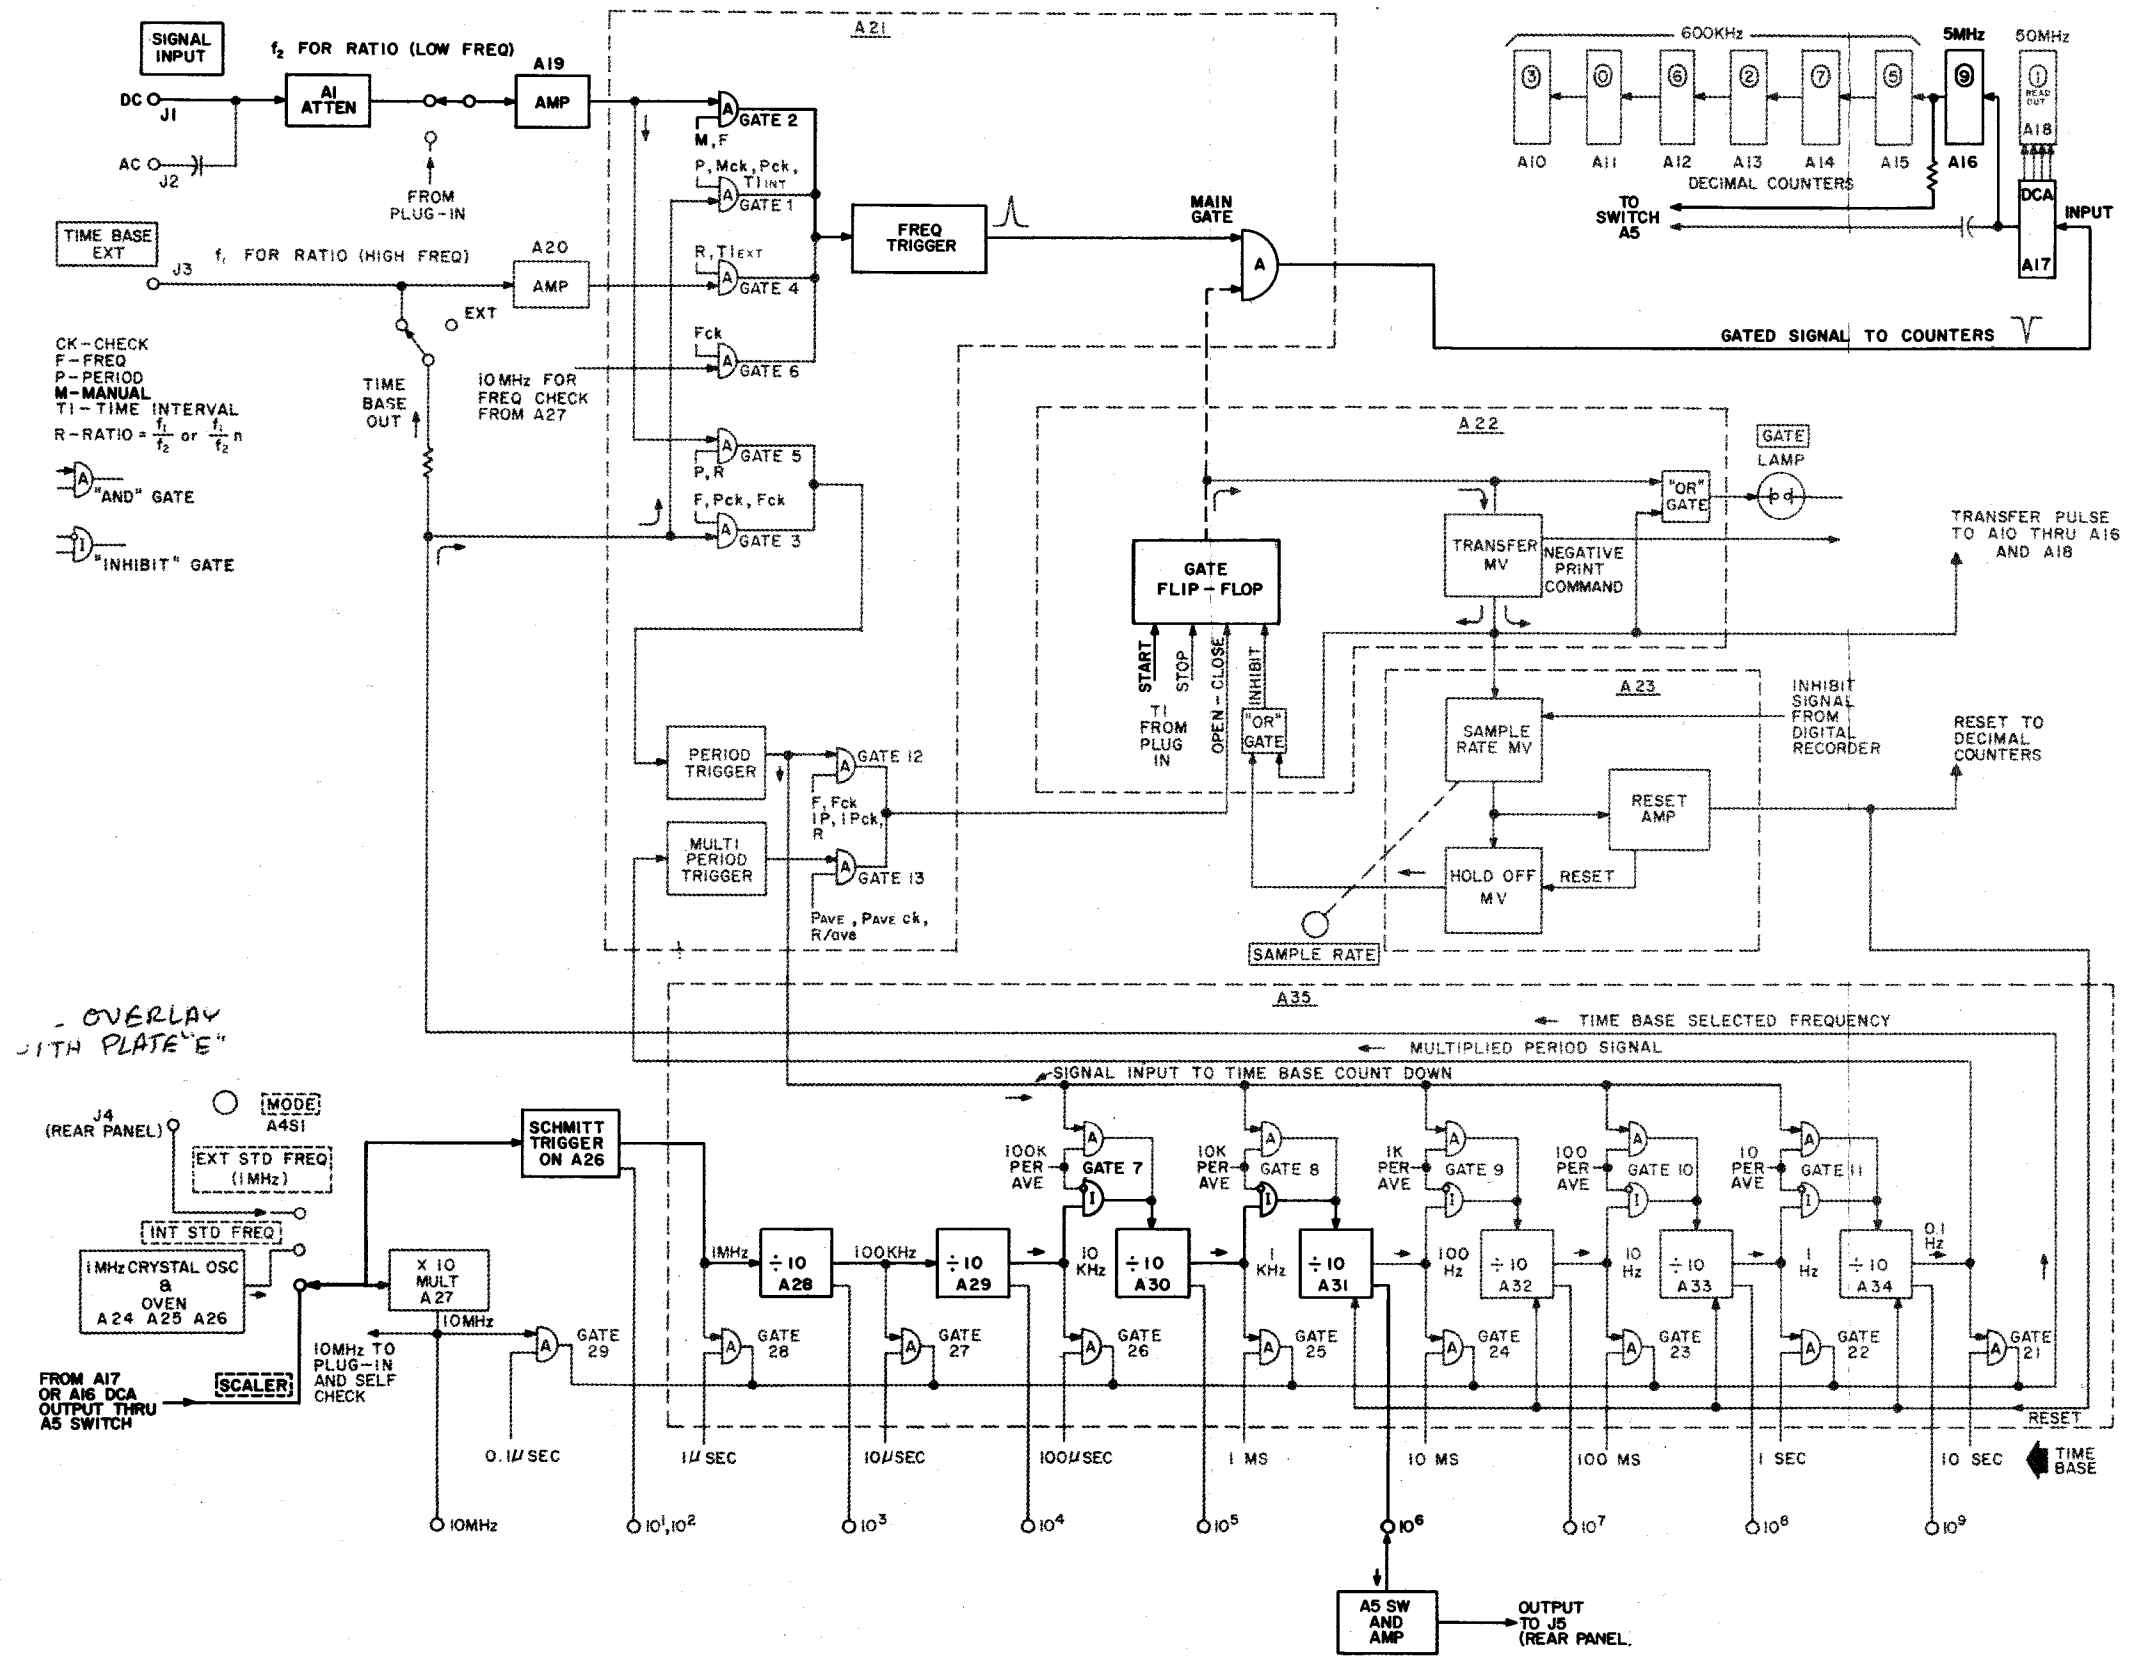

Figure 6-11. Scaling
6-25/6-26

SECTION VII

CIRCUIT DIAGRAMS

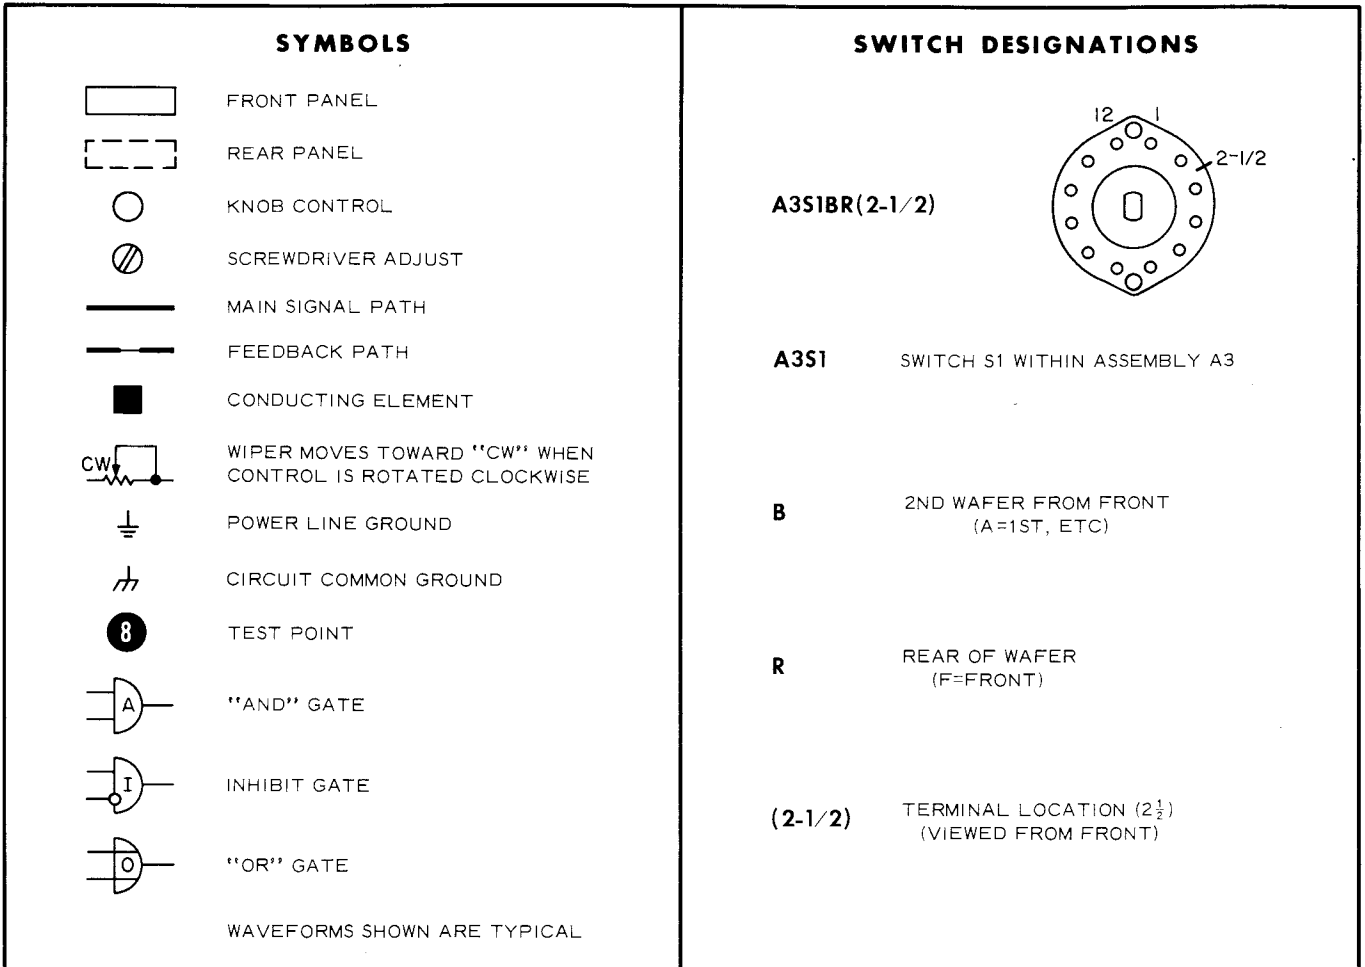

7-1. INTRODUCTION.

7-2. This section includes the following:

- a. General Notes for Schematic Diagrams (Figure 7-1).
- b. Block Diagram (Figure 7-2).
- c. Schematic Diagrams and Component Location illustrations of Model 5245L circuits, assemblies and connectors in the order of their assembly designation (A1 through A35, Figures 7-3 through 7-26). These figures may also include waveforms and voltages.
- d. Schematic Diagrams and Component Location illustrations for Options 02 and 03 assemblies follow after the standard assembly they replace (Figures 7-10, 7-12, 7-15, and 7-16).

7-3. The Block Diagram or any schematic diagram, when unfolded, can be used with any other part of this manual, or with the manual closed.

7-4. DC voltages are measured with a  Model 412A DC Voltmeter. Typical voltages are shown.

REFERENCE DESIGNATIONS

REFERENCE DESIGNATIONS WITHIN ASSEMBLIES ARE ABBREVIATED. ADD ASSEMBLY NUMBER TO ABBREVIATION FOR COMPLETE DESCRIPTION.

ASSEMBLY	ABBREVIATION	COMPLETE DESCRIPTION
A25	C1	A25C1
A25A1	CR1	A25A1CR1
NO PREFIX	J3	J3

NOTES

1 SYMBOLS

2 GENERAL ABBREVIATIONS

- DP = DECIMAL POINT
- DR = DIGITAL RECORDER
- GC = GATE CONTROL
- MU = MEASUREMENT UNIT
- BCD = BINARY CODED DECIMAL
- DCA = DECIMAL COUNTER ASSY
- DDA = DECADE DIVIDER ASSY
- MPS = MULTIPLIED PERIOD SIG

3 SWITCH SITUATION ABBREVIATIONS

- . = AND
- + = OR
- C = INPUT SWITCH: CHECK
- ̄ = INPUT SWITCH: NOT CHECK
- E = TIME BASE SWITCH: EXT
- ̄E = TIME BASE SWITCH: NOT EXT
- F = FUNCTION SWITCH: FREQUENCY
- M = FUNCTION SWITCH: MANUAL START OR MANUAL STOP
- ̄M = FUNCTION SWITCH: NOT (MANUAL START OR MANUAL STOP)
- P = FUNCTION SWITCH: PERIOD AVERAGE (FOR ANY POSITION)
- PA = FUNCTION SWITCH: PERIOD AVERAGE (FOR SPECIFIC POSITION)
- R = FUNCTION SWITCH: REMOTE OR TIME INT
- ̄R = FUNCTION SWITCH: NOT (REMOTE OR TIME INT)

- 4 DP LAMPS ARE DESIGNATED 0 THRU 7 FOR EACH POSITION FROM RIGHT TO LEFT AS VIEWED FROM FRONT
- 5 DP AND MU LAMPS OPERATE AS TABULATED WHEN INPUT SWITCH IS NOT CHECK. LAMPS OPERATE IN CHECK ONLY IF FUNCTION SWITCH IS SET TO FREQUENCY
- 6 DP AND MU LAMPS ARE LIGHTED BY +170V CONTROL SUPPLIED TO APPROPRIATE A8-A9 TERMINAL FROM SWITCH OR J10
- 7 TIME RELATIONSHIPS

GATE CONTROL SUMMARY (NOTE 3)

GATE CONTROL DESIGNATION	INTERNAL CONTROL		REMOTE CONTROL (J9 PIN NO.)
	SWITCH SITUATION FOR ON STATE (-15V), WITH (PLUG IN OFF)	SOURCE

REFERENCE DESIGNATIONS WITHIN READOUT ASSEMBLY ARE ABBREVIATED; TO FORM COMPLETE DESIGNATION, ADD ASSEMBLY DESIGNATION 'A18' AS PREFIX TO INDICATED DESIGNATION

Figure 7-16. A18 Readout (05245-6003) Option 03

NOTES

1. UNLESS OTHERWISE INDICATED :
RESISTANCE IN OHMS ;
CAPACITANCE IN PICO FARADS
2. REFERENCE DESIGNATIONS IN PARENTHESES
INDICATE LIGHT DESTINATION FOR DS1 - DS4.
LIGHT SOURCE IS NOTED NEAR EACH VI SECTION.
3. FOR DS1 - DS4, SECTION A LIGHTS ON "1" ;
SECTION B LIGHTS ON "0"
4. FILLED SQUARE (■) INDICATES CONDUCTING
ELEMENT FOR DECIMAL "0" (BCD "0000")
5. OUTPUT CODE:
OPTION 03: I= -8V, O= +18V
